### Table of Contents:

1. Number of unique conformers at each step.....	2
2. Benchmarks .....	3
3. Ring Puckering and distribution of glycosidic bonds.....	5
4. CCS vs Free energies.....	19
5. Simulated anharmonic spectra of 18 low-free energy conformers.....	23
6. Vibrational assignment of the 18 low-energy conformers.....	26
7. XYZ-coordinates of 18 low-energy conformers .....	44

**Table S1:** Unique Conformers after CREST search. The highlighted rows indicate conformers that increased number of unique structures after the second search.

The spectra between 1000-1250  $cm^{-1}$  is computed using anharmonic corrections, while the amide I band is calculated using harmonic vibrations.  $\Delta F$  indicates relative free energy with respect to the global minimum (in kcal mol $^{-1}$ ), and  $\Delta C$  indicates a difference in CCS from experimental value of 144  $\text{\AA}^2$ .

**Figure S23:** Simulated vibrational spectra of the lowest-free energy conformers of  $[a16+H]^+$  ions. (C) and ( $^2C$ ) represent the most stable and second most stable conformers of alpha anomers respectively. (C') represents the most stable beta anomers of the same ions above. All spectra are compared to the experimental IR spectrum of  $[a16+H]^+$  (Top spectrum). The disconnected experimental line indicates two regions where a different laser power was used. The spectra between 1000-1250  $cm^{-1}$  is computed using anharmonic corrections, while the amide I band is calculated using harmonic vibrations.  $\Delta F$  indicates relative free energy with respect to the global minimum (in kcal mol $^{-1}$ ), and  $\Delta C$  indicates a difference in CCS from experimental value of 144  $\text{\AA}^2$ .
