$\langle \epsilon \rangle$  is the average CD–water interaction energy;  $\langle \epsilon_{elec} \rangle$  and  $\langle \epsilon_{disp} \rangle$  are the electrostatic and dispersion contributions to the CD–water interaction energy, respectively. The average and standard deviations are obtained from block averaging by dividing the simulation trajectory into three equal blocks

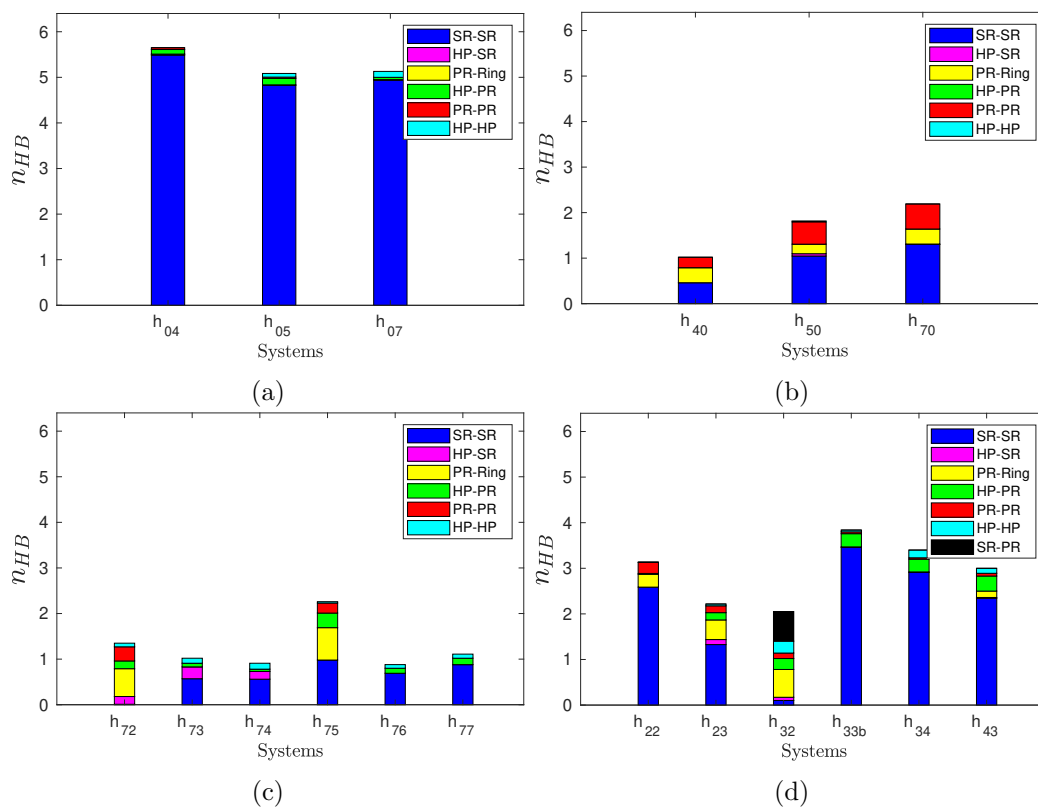

Figure S3: Statistics on the various CD-CD hydrogen bonds in HP $\beta$ CDs: a) substitution only in the primary rim; (b) substitution only in the secondary rim; (c) increase in the substitution in the primary rim when all the glucose units in the secondary rim are substituted; (d) when glucose units are substituted either at the primary or the secondary hydroxyl rim but not both. Notation in the legends: SR - secondary rim oxygen atoms (O2/O3) ; PR - primary rim oxygen atoms (O6); HP - oxygen atoms of 2-hydroxypropyl; Ring - glucose ring oxygen atom (O5).
