<sup>a</sup> Quartet 1B was chosen as the energy reference.

<sup>b</sup> Not successfully located.

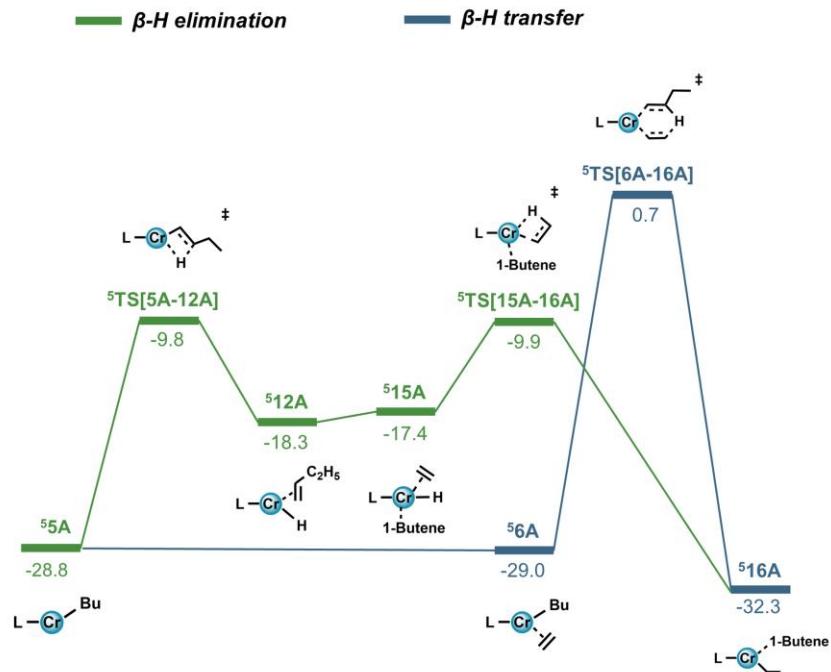

<sup>c</sup> The intermediates and transition states under the sextet are energetically disfavoured and most of the chromacycle species can not maintain cyclic structure.

**S2. The formation of Cr-butyl species and comparation of two possible chain termination processes**

As illustrated in Figure S1, coordination and insertion of two molecule ethylene monomers to generate a Cr-butyl specie was exoergic by 28.8 kcal mol<sup>-1</sup>. It is necessary to consider the two potential termination routes ( $\beta$ -H elimination versus  $\beta$ -H transfer) to decide which one can occur. Figure S2 shows these two possibilities and the activation barrier of  $\beta$ -H transfer route via <sup>5</sup>TS[6A-16A] was calculated to be 0.7 kcal mol<sup>-1</sup>. Due to the relatively high energy barrier (10.7 kcal mol<sup>-1</sup>) compared to  $\beta$ -H elimination, the  $\beta$ -H transfer route can be immediately ruled out. It is notable that the original  $\beta$ -H elimination to give a Cr-hydride (<sup>5</sup>5A  $\rightarrow$  <sup>5</sup>12A) was endergonic by 10.5 kcal mol<sup>-1</sup>, which means this reaction is not spontaneous and will return to Cr-butyl in the absence of ethylene. Similar results have been observed in all calculations towards Cossee-Arlman mechanism involving  $\beta$ -H elimination step.<sup>14</sup> Aiming at this phenomenon, a supplemental route was first proposed by McGuinness and co-workers.<sup>1</sup> Once the  $\beta$ -H elimination is achieved, the chromium centre tends to capture an incoming monomer to form a more stable Cr-ethyl species due to the relative low energy barrier of ethylene insertion. This process was also considered in this work and was found to do not impact the overall selectivity.

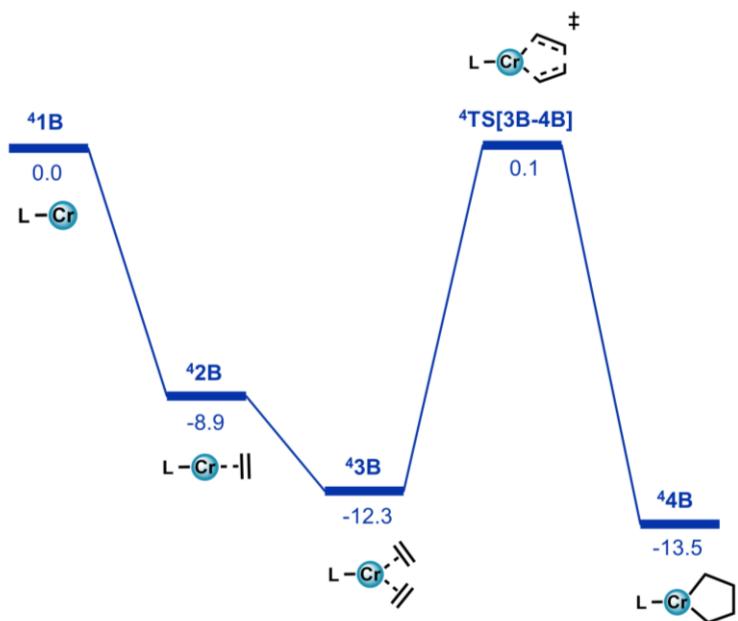

**Figure S1.** Calculated free energy diagrams for the formation of Cr-butyl species. The relative Gibbs free energies calculated at the M06L-D3/def2-TZVP//B3LYP-D3/def2-SVP level are given in kcal mol<sup>-1</sup>. The superscript numbers in the diagrams refer to the spin multiplicity.

**Figure S2.** Calculated free energy diagrams for chain termination via stepwise  $\beta$ -H elimination (green line) and concerted  $\beta$ -H transfer (gray line). The relative Gibbs free energies calculated at the M06L-D3/def2-TZVP//B3LYP-D3/def2-SVP level are given in kcal mol<sup>-1</sup>. The superscript numbers in the diagrams refer to the spin multiplicity.

**S3. The formation of metallacyclopentane**

**Figure S3.** Calculated free energy diagrams for the formation of metallacyclopentane. The relative Gibbs free energies calculated at the M06L-D3/def2-TZVP//B3LYP-D3/def2-SVP level are given in kcal mol<sup>-1</sup>. The superscript numbers in the diagrams refer to the spin multiplicity.

#### S4. Conformational searching

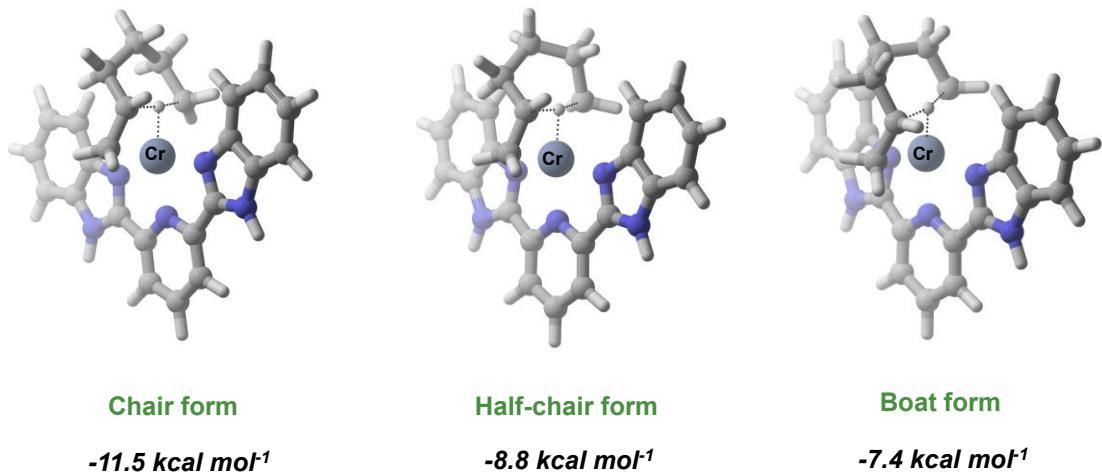

Various conformers exist for the key intermediate due to the flexibility of alkyl groups. The capture of lowest conformer is critical for the establishment of decisive free energy surface.<sup>5</sup> As for 3,7-H shift structure <sup>4</sup>TS[6B-11B], conformational searching furnished three unique conformers which were called chair conformation, half-chair conformation, and boat conformation (Figure S4). Among them, chair form was found to be most stable. The results of conformational searching along the Cossee-Arlman route and metallacycle route are listed in Table S3 and Table S4, respectively.

**Table S3.** Various conformers of key intermediates and transition states for Cr/NNN-catalysed ethylene oligomerization via a Cossee-Arlman mechanism.

**Figure S6.** Lowest energy conformers of key intermediates and transition states for the catalytic cycle involving a metallacycle mechanism.

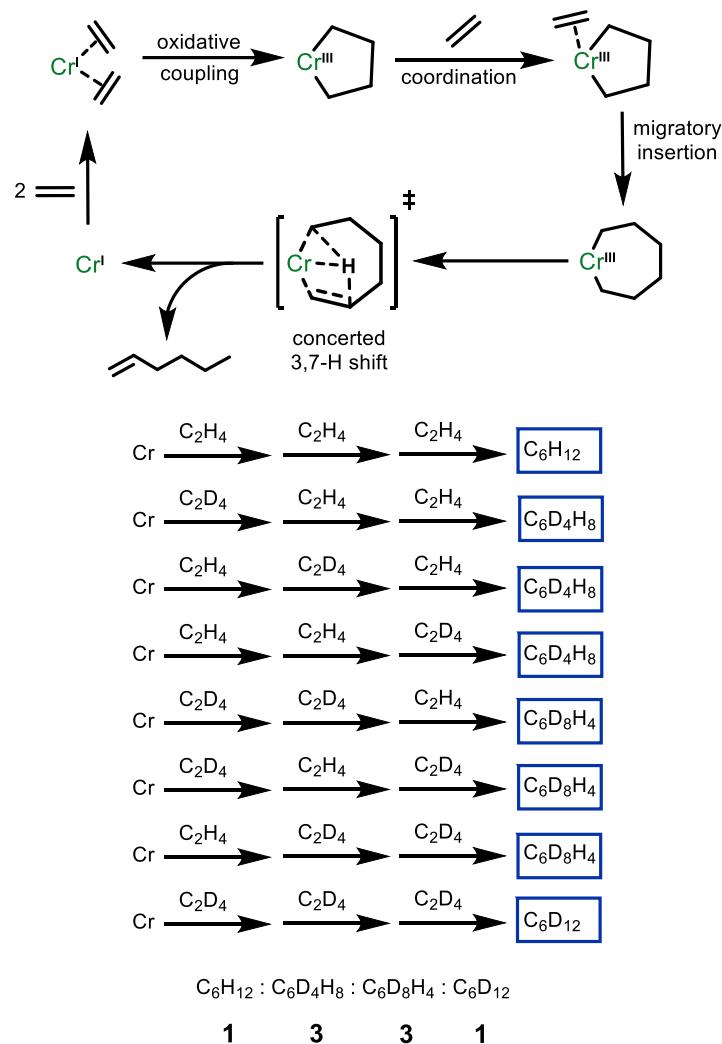

### S6. Kinetic Isotope Effect on the 3,7-H shift process

Isotope effect on the 3,7-H shift process of Cr/NNN system was further examined and DFT calculation results (Figure S7) revealed a relatively small KIE value (1.9) compared to  $\beta$ -H elimination step (4.4). It is reasonable to speculate that two types of hydrogen transform mode will lead to different KIE. The presence of KIE causes a deviation of isotopic products distribution from the ideal. However, no matter how large the kinetic isotope effect is, metallacycle routes always deliver even-numbered isotopomers since concerted H-shift process occurs inside the chromacycle.

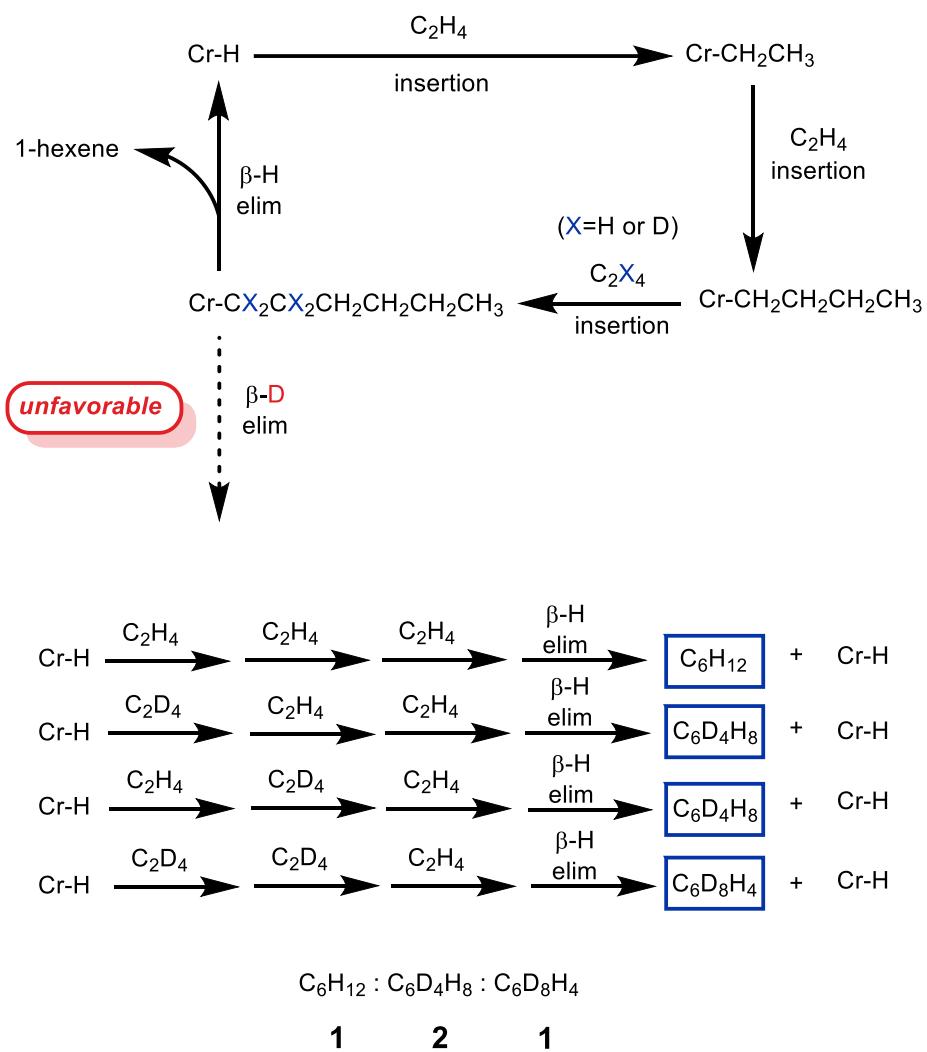

**Figure S7.** KIE on the 3,7-H shift process of metallacycle mechanism.

**S7. The formation of isotopic metallacycloheptane via a metallacycle mechanism and theoretical distribution of 1-hexene**

**Figure S8.** Proposed metallacycle mechanism for 1-hexene formation (top) and expected isotopomers distribution from a 1:1  $\text{C}_2\text{D}_4 / \text{C}_2\text{H}_4$  mixture with negligible KIE (bottom).

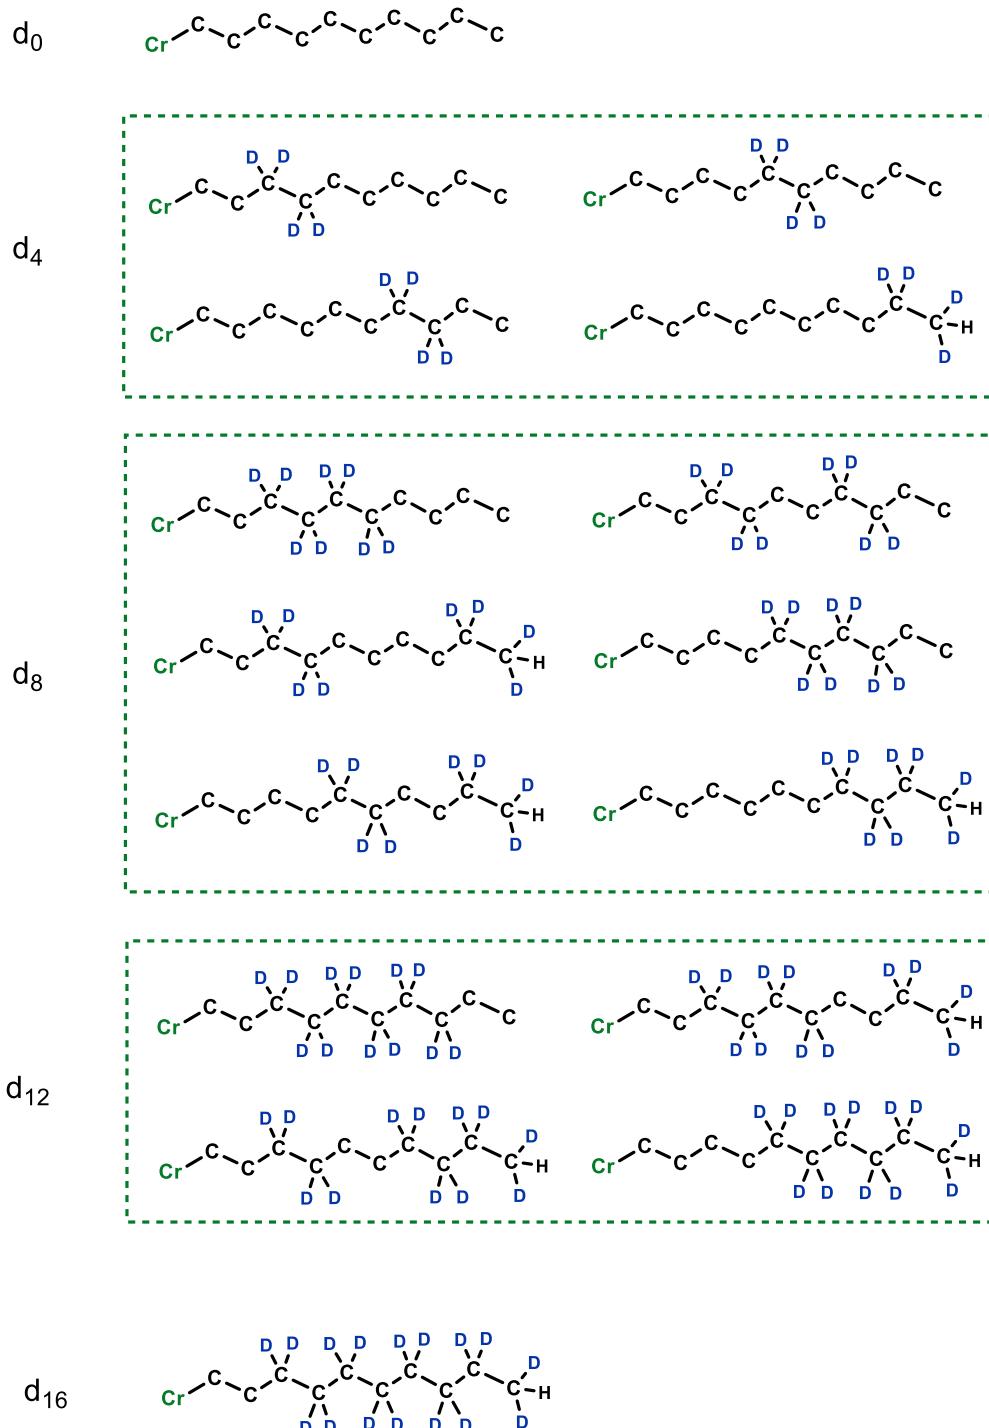

**S8.** Expected isotopomeric 1-hexene via a Cossee-Arlman mechanism in this case

**Figure S9.** Proposed Cossee-Arlman mechanism for 1-hexene formation (top) and expected isotopomers distribution from a 1:1  $\text{C}_2\text{D}_4 / \text{C}_2\text{H}_4$  mixture when KIE is considered (bottom).

### **S9. Explanation of the gas chromatography data in Cr/NNN system**

As for 1-C<sub>10</sub> products, metallacycle mechanism with negligible KIE is supposed to form isotopic C<sub>10</sub>D<sub>20</sub>, C<sub>10</sub>D<sub>16</sub>H<sub>4</sub>, C<sub>10</sub>D<sub>12</sub>H<sub>8</sub>, C<sub>10</sub>D<sub>8</sub>H<sub>12</sub>, C<sub>10</sub>D<sub>4</sub>H<sub>16</sub>, C<sub>10</sub>H<sub>20</sub> products in a ratio of 1:5:10:10:5:1. And this distribution will transform to a ratio of 2:7:9:5:1 of C<sub>10</sub>D<sub>16</sub>H<sub>4</sub>, C<sub>10</sub>D<sub>12</sub>H<sub>8</sub>, C<sub>10</sub>D<sub>8</sub>H<sub>12</sub>, C<sub>10</sub>D<sub>4</sub>H<sub>16</sub>, C<sub>10</sub>H<sub>20</sub> when KIE is included. It can be seen that Cossee-type isotopomers distribution are quite similar to metallacycle routes when KIE is both considered in these two proposals. However, the C<sub>10</sub>D<sub>16</sub>H<sub>4</sub>, C<sub>10</sub>D<sub>12</sub>H<sub>8</sub>, C<sub>10</sub>D<sub>8</sub>H<sub>12</sub>, C<sub>10</sub>D<sub>4</sub>H<sub>16</sub>, C<sub>10</sub>H<sub>20</sub> products delivered by a Cossee-Arlman mechanism (KIE included) in a ratio of 1:4:6:4:1 (Figure S10) are in great agreement of original data in the literature.<sup>6</sup> In addition, the peaks of isotopic 1-C<sub>12</sub> and 1-C<sub>14</sub> from an oligomerization of 1:1 C<sub>2</sub>H<sub>4</sub> / C<sub>2</sub>D<sub>4</sub> also give a best fit to the Cossee-Arlman mechanism when an isotope effect was considered (Figure S11).

1          4          6          4          1

**Figure S10.** All expected isotopomers of 1-C<sub>10</sub> and their statistical distribution for a Cossee-Arlman mechanism when KIE is considered.
