## EXPERIMENTAL SECTION:

General Materials and Methods. Reactions requiring an inert atmosphere were carried out under positive pressure of $\mathrm{N}_{2}$ using flasks fitted with Suba-Seal rubber septa and standard Schlenk techniques. Air and moisture sensitive reagents were transferred using standard syringe or cannula techniques. Reagents and solvents were purchased from Sigma Aldrich, Acros, Fisher, Strem, Oakwood, or Cambridge Isotopes Laboratories. DMBil1, Pd[DMBil1], and Pd[DMBiIBr ${ }_{2}$ ] were synthesized according to published procedures. ${ }^{1-6}$ Solvents used for synthesis were of reagent grade or better. Anhydrous solvents were dried by passage through activated alumina and stored over $4 \AA$ molecular sieves prior to use. Column chromatography was performed with 40-63 $\mu \mathrm{m}$ silica gel from Silicycle.

Compound Characterization. ${ }^{1} \mathrm{H}$ NMR, ${ }^{13} \mathrm{C}\left\{{ }^{1} \mathrm{H}\right\}$ NMR, and ${ }^{19} \mathrm{~F}$ NMR spectra were measured at $25^{\circ} \mathrm{C}$ on a Bruker 400 MHz spectrometer with a cryogenic QNP probe. Proton spectra are refenced to the residual proton resonance of the deuterated solvent $\left(\mathrm{CDCl}_{3}=\delta 7.26\right)$ and carbon spectra are referenced to the carbon resonance of the solvent $\left(\mathrm{CDCl}_{3}=\delta 77.16\right) .{ }^{7}$ Fluorine spectra are referenced to an external trifluoroacetic acid standard (TFA $=\delta-76.55$ in $\left.\mathrm{CD}_{3} \mathrm{CN}\right) .{ }^{8}$ All chemical shifts are reported using the standard $\delta$ notation in parts-per-million; positive chemical shifts are to higher frequency from given reference. Data are reported as follows: chemical shift, multiplicity ( $\mathrm{s}=$ singlet, $\mathrm{d}=$ doublet, $\mathrm{t}=$ triplet, $\mathrm{q}=\mathrm{quartet}$, hept $=$ heptet, $\mathrm{m}=$ multiplet), coupling constants, and number or protons. High-resolution mass spectrometry analyses were performed by the University of Delaware Mass Spectrometry Laboratory in the Department of Chemistry and Biochemistry.

[^0]of anhydrous triethylamine ( 3 mL ) and phenylacetylene ( $164 \mathrm{ml}, 1.5 \mathrm{mmol}, 10$ equiv) and stirring for 15 minutes at room temperature. Positive pressure of nitrogen gas was then applied and the septum was removed in order to add palladium 2,18-dibromo-10,10-dimethyl-5,15dipentafluorophenylbiladiene ( $\left.\left.\mathrm{Pd}_{\mathrm{D}} \mathrm{DMBilBr}_{2}\right]\right)(138 \mathrm{mg}, 0.15 \mathrm{mmol}, 1.0$ equiv) and tetrakispalladium(0) triphenylphosphine ( $34 \mathrm{mg}, 0.030 \mathrm{mmol}, 20 \mathrm{~mol} \%$ ). The septum was then replaced and anhydrous tetrahydrofuran ( 40 mL ) was cannula transferred into the flask, where upon the solution was stirred at $75^{\circ} \mathrm{C}$ for 16 hours. After the time elapsed, the solution was cooled to room temperature then exposed to air and diluted with 50 mL of ethyl acetate. The resulting solution was washed once with saturated ammonium chloride solution and once with brine, then dried over sodium sulfate and concentrated via rotary evaporation. The crude material was purified by column chromatography on silica using $10 \% \mathrm{CH}_{2} \mathrm{Cl}_{2}$ in hexanes to yield $121 \mathrm{mg}(0.13 \mathrm{mmol})$ target material as a maroon solid in $84 \%$ yield. ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}, 25^{\circ} \mathrm{C}$ ) $\delta / \mathrm{ppm}$ : 7.57 (s, $2 \mathrm{H}), 7.45(\mathrm{~d}, 4 \mathrm{H}), 7.28(\mathrm{~m}, 6 \mathrm{H}) 6.74(\mathrm{~d}, \mathrm{~J}=4.8 \mathrm{~Hz}, 2 \mathrm{H}), 6.69(\mathrm{~s}, 2 \mathrm{H}), 6.61(\mathrm{~d}, \mathrm{~J}=4.8 \mathrm{~Hz}, 2 \mathrm{H})$, $1.82(\mathrm{~s}, 6 \mathrm{H}), 1.29(\mathrm{~s}, 16 \mathrm{H}) .{ }^{13} \mathrm{C}\left\{{ }^{1} \mathrm{H}\right\} \mathrm{NMR}\left(100 \mathrm{MHz}, \mathrm{CDCl}_{3}, 25^{\circ} \mathrm{C}\right)$ §/ppm: 168.4, 153.0, 136.0, 134.0, 132.3, 131.5, 129.8, 128.4, 128.1, 123.5, 118.1, 113.7, 91.9, 83.6, 42.1, 31.0. ${ }^{19} \mathrm{~F}$ NMR (251 MHz, CDCl $\left.{ }_{3}, 25^{\circ} \mathrm{C}\right) ~ \delta / p p m:-137.8(\mathrm{dt}, J=8.8,5.2,4 \mathrm{~F}),-151.2(\mathrm{dt}, J=8.8,5.0 \mathrm{~Hz}, 2 \mathrm{~F}),-$ 160.0 (dt, $J=10.1,3.8 \mathrm{~Hz}, 4 \mathrm{~F}$ ). HR-ESI-MS: $[\mathrm{M}+\mathrm{H}]^{+} \mathrm{m} / \mathrm{z}$ : calcd for $\mathrm{C}_{49} \mathrm{H}_{25} \mathrm{~N}_{4} \mathrm{~F}_{10} \mathrm{Pd}$, 965.09758 ; found 965.09758 .

All other Pd[DMBil2-R] derivatives were synthesized using the same procedure, altering only the identity of the alkyne added and the chosen eluent for chromatography. Detailed methods of purification and characterization data for all other Pd[DMBil2-R] derivatives are provided below:

Palladium
2,18-Bis(para-cyano-phenylethynyl)-10,10-dimethyl-5,15dipentafluorophenylbiladiene (Pd[DMBil2-CN]): This compound was prepared on a 0.15 mmol scale from $\operatorname{Pd}\left[\mathrm{DMBilBr}_{2}\right]$ and 4-cyanophenylacetylene following the method detailed for Pd[DMBil2-H]. The crude material was purified by column chromatography on silica using 10\%
ethyl acetate in hexanes to yield $86 \mathrm{mg}(0.085 \mathrm{mmol})$ of target material as a maroon solid in $57 \%$ yield. ${ }^{1} \mathrm{H}$ NMR $\left(600 \mathrm{MHz}, \mathrm{CDCl}_{3}, 25^{\circ} \mathrm{C}\right) \delta / \mathrm{ppm}: 7.57(\mathrm{~s}, 2 \mathrm{H}), 7.56(\mathrm{~d}, \mathrm{~J}=8.4 \mathrm{~Hz}, 4 \mathrm{H}) 7.49(\mathrm{~d}, J=$ $8.4 \mathrm{~Hz}, 4 \mathrm{H}), 6.79(\mathrm{~d}, J=4.6 \mathrm{~Hz}, 2 \mathrm{H}), 6.72(\mathrm{~s}, 2 \mathrm{H}), 6.67(\mathrm{~d}, J=4.6 \mathrm{~Hz}, 2 \mathrm{H}), 1.83(\mathrm{~s}, 6 \mathrm{H}) .{ }^{13} \mathrm{C}\left\{{ }^{1} \mathrm{H}\right\}$ NMR ( $\left.151 \mathrm{MHz}, \mathrm{CDCl}_{3}, 25^{\circ} \mathrm{C}\right) ~ \delta / \mathrm{ppm}: 169.3,152.2,145.0(\mathrm{~d}, \mathrm{~J}=257.9 \mathrm{~Hz}), 136.5,133.9,133.1$, 132.3, 132.2, 132.2, 132.1, 131.7, 129.8, 128.7, 128.6, 128.5, 118.9, 118.7, 112.3, 111.2, 90.3 , 88.6, 42.4, 31.0. ${ }^{19} \mathrm{~F}$ NMR ( $377 \mathrm{MHz}, \mathrm{CDCl}_{3}, 25^{\circ} \mathrm{C}$ ) $\delta / \mathrm{ppm}:-138.4$ (dd, $J=10.8,3.8,4 \mathrm{~F}$ ), -151.2 (t, $J=13.8,2 \mathrm{~F}),-160.3(\mathrm{dt}, J=13.8,3.8,4 \mathrm{~F})$. HR-ESI-MS: $[\mathrm{M}+\mathrm{H}]^{+} \mathrm{m} / \mathrm{z}$ : calcd for $\mathrm{C}_{51} \mathrm{H}_{22} \mathrm{~N}_{6} \mathrm{~F}_{10} \mathrm{Pd}$, 1015.08593; found 1015.08828.

Palladium 2,18-Bis(para-trifluoromethyl-phenylethynyl)-10,10-dimethyl-5,15dipentafluorophenylbiladiene ( $\mathrm{Pd}\left[\mathrm{DMBil2}-\mathrm{CF}_{3}\right]$ ): This compound was prepared on a 0.15 mmol scale from $\operatorname{Pd}\left[\mathrm{DMBilBr}_{2}\right]$ and 4-trifluoromethylphenylacetylene following the method detailed for Pd[DMBil2-H]. The crude material was purified by column chromatography on silica using $10 \%$ ethyl acetate in hexanes to yield $127 \mathrm{mg}(0.12 \mathrm{mmol})$ of target material as a purple solid in $77 \%$ yield. ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}, 25^{\circ} \mathrm{C}$ ) $\delta / \mathrm{ppm}$ : 7.57 (s, 2H), 7.54 (s, 8 H ), 6.78 (d, J $=4.6 \mathrm{~Hz}, 2 \mathrm{H}), 6.72(\mathrm{~s}, 2 \mathrm{H}), 6.65(\mathrm{~d}, \mathrm{~J}=4.6 \mathrm{~Hz}, 2 \mathrm{H}), 1.83(\mathrm{~s}, 6 \mathrm{H}) .{ }^{13} \mathrm{C}\left\{{ }^{1} \mathrm{H}\right\} \mathrm{NMR}\left(100 \mathrm{MHz}, \mathrm{CDCl}_{3}\right.$, $\left.25^{\circ} \mathrm{C}\right) ~ \delta / p p m: ~ 168.9,152.4,136.2,133.8,132.7,131.4,129.7,129.6,128.6,127.3,125.3,125.2$, 125.1, 122.3, 118.5, 112.6, 90.4, 86.2, 42.2, 30.8. ${ }^{19} \mathrm{~F}$ NMR ( $251 \mathrm{MHz}, \mathrm{CDCl}_{3}, 25{ }^{\circ} \mathrm{C}$ ) $\delta / \mathrm{ppm}:-$ 62.2 ( $\mathrm{s}, 6 \mathrm{~F}$ ), -137.9 (dd, $J=9.4,3.8,4 \mathrm{~F}),-150.9(\mathrm{t}, \mathrm{J}=12.6,2 \mathrm{~F}),-159.8(\mathrm{dt}, J=12.6,3.8,4 \mathrm{~F})$. HR-ESI-MS: $[\mathrm{M}+\mathrm{H}]^{+} \mathrm{m} / \mathrm{z}$ : calcd for $\mathrm{C}_{51} \mathrm{H}_{23} \mathrm{~N}_{4} \mathrm{~F}_{16} \mathrm{Pd}$, 1101.07021; found 1101.07022.

## Palladium 2,18-Bis(para-methyl-ester-phenylethynyl)-10,10-dimethyl-5,15-

 dipentafluorophenylbiladiene $\left(\mathbf{P d}\left[\mathrm{DMBil2}-\mathbf{C O}_{2} \mathbf{C H}_{3}\right]\right)$ : This compound was prepared on a 0.15 mmol scale from $\operatorname{Pd}\left[\mathrm{DMBilBr}_{2}\right]$ and 4-(methoxycarbonyl)phenylacetylene following the method detailed for Pd[DMBil2-H]. The crude material was purified by column chromatography on silica using $10 \%$ ethyl acetate in hexanes to yield $118 \mathrm{mg}(0.11 \mathrm{mmol})$ of target material as a maroon solid in $73 \%$ yield. ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}, 25^{\circ} \mathrm{C}$ ) $\delta / \mathrm{ppm}: 7.96(\mathrm{~d}, \mathrm{~J}=8 \mathrm{~Hz}, 4 \mathrm{H}), 7.57(\mathrm{~s}, 2 \mathrm{H})$,$7.49(\mathrm{~d}, J=8 \mathrm{~Hz}, 4 \mathrm{H}), 6.78(\mathrm{~d}, J=4.6 \mathrm{~Hz}, 2 \mathrm{H}), 6.72(\mathrm{~s}, 2 \mathrm{H}), 6.64(\mathrm{~d}, J=4.6 \mathrm{~Hz}, 2 \mathrm{H}), 3.90(\mathrm{~s}, 6 \mathrm{H})$, 1.83 (s, 6H). ${ }^{13} \mathrm{C}\left\{{ }^{1} \mathrm{H}\right\}$ NMR ( $100 \mathrm{MHz}, \mathrm{CDCl}_{3}, 25^{\circ} \mathrm{C}$ ) $\delta / \mathrm{ppm}$ : 168.9, 168.7, 152.6, 136.3, 133.9, 132.7, 131.2, 129.9, 129.6, 129.2, 128.7, 128.3, 118.5, 112.9, 91.3, 87.0, 52.4, 42.3, 31.0. ${ }^{19} \mathrm{~F}$ NMR (251 MHz, $\left.\mathrm{CDCl}_{3}, 25^{\circ} \mathrm{C}\right) ~ \delta / p p m:-137.8(\mathrm{dd}, J=9.4,3.8,4 \mathrm{~F}),-150.9(\mathrm{t}, J=13.8,2 \mathrm{~F}),-159.9$ (dt, $J=13.8,3.8,4 \mathrm{~F}$ ). HR-ESI-MS: $[\mathrm{M}+\mathrm{H}]^{+} \mathrm{m} / \mathrm{z}$ : calcd for $\mathrm{C}_{53} \mathrm{H}_{41} \mathrm{~N}_{4} \mathrm{~F}_{10} \mathrm{O}_{4} \mathrm{Pd}$, 1025.11657 ; found 1025.11705.

## Palladium

2,18-Bis(para-tert-butyl-phenylethynyl)-10,10-dimethyl-5,15dipentafluorophenylbiladiene (Pd[DMBil2-t-Bu]): This compound was prepared on a 0.15 mmol scale from $\operatorname{Pd}\left[\mathrm{DMBilBr}_{2}\right]$ and 4-tert-butylphenylacetylene following the method detailed for Pd[DMBil2-H]. The crude material was purified by column chromatography on silica using 10\% $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ in hexanes to yield $130 \mathrm{mg}(0.12 \mathrm{mmol})$ of target material as a maroon solid in $81 \%$ yield. ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}, 25^{\circ} \mathrm{C}$ ) $\delta / \mathrm{ppm}: 7.57(\mathrm{~s}, 2 \mathrm{H}), 7.26(\mathrm{~d}, \mathrm{~J}=9.6 \mathrm{~Hz}, 4 \mathrm{H}), 7.31(\mathrm{~J}=9.6 \mathrm{~Hz}$, $6 \mathrm{H}) 6.75(\mathrm{~d}, J=4.6 \mathrm{~Hz}, 2 \mathrm{H}), 6.71(\mathrm{~s}, 2 \mathrm{H}), 6.62(\mathrm{~d}, J=4.6 \mathrm{~Hz}, 2 \mathrm{H}), 1.83(\mathrm{~s}, 6 \mathrm{H}) .{ }^{13} \mathrm{C}\left\{{ }^{1} \mathrm{H}\right\}$ NMR (100 $\left.\mathrm{MHz}, \mathrm{CDCl}_{3}, 25^{\circ} \mathrm{C}\right) \delta / \mathrm{ppm}: 168.2,153.2,151.3,145.0(\mathrm{~d}, \mathrm{~J}=246.2 \mathrm{~Hz}), 141.9(\mathrm{~d}, J=248.4 \mathrm{~Hz})$, $137.5(\mathrm{~d}, \mathrm{~J}=254.7 \mathrm{~Hz}), 135.9,134.0,132.1,131.2,129.7,128.4,125.4,120.5,117.9,114.1$, 111.9 ( $\mathrm{t}, \mathrm{J}=19.0 \mathrm{~Hz}$ ), 92.1, 82.9, 77.4, 42.1, 36.7, 34.9, 31.6, 31.3, 31.0. ${ }^{19} \mathrm{~F}$ NMR ( 251 MHz , $\mathrm{CDCl}_{3}, 25{ }^{\circ} \mathrm{C}$ ) $\delta / \mathrm{ppm}:-138.3(\mathrm{dd}, J=11.3,3.8,4 \mathrm{~F}),-151.8(\mathrm{t}, J=13.8,2 \mathrm{~F}),-160.6(\mathrm{dt}, J=13.8$, 3.8, 4F). HR-LIFDI-MS: $[\mathrm{M}+\mathrm{H}]^{+} \mathrm{m} / \mathrm{z}$ : calcd for $\mathrm{C}_{57} \mathrm{H}_{40} \mathrm{~N}_{4} \mathrm{~F}_{10} \mathrm{Pd}$, 1076.2128; found 1076.1862.

Palladium
2,18-Bis(para-methoxy-phenylethynyl)-10,10-dimethyl-5,15dipentafluorophenylbiladiene ( $\mathrm{Pd}\left[\mathrm{DMBil2}-\mathbf{O C H}_{3}\right]$ ): This compound was prepared on a 0.15 mmol scale from $\operatorname{Pd}\left[\mathrm{DMBilBr}_{2}\right]$ and 4-methoxyphenylacetylene following the method detailed for Pd[DMBil2-H]. The crude material was purified by column chromatography on silica using $15 \%$ ethyl acetate in hexanes to yield $132 \mathrm{mg}(0.13 \mathrm{mmol})$ of target material as a purple solid in $86 \%$ yield. ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}, 25^{\circ} \mathrm{C}$ ) $\delta / \mathrm{ppm}: 7.57(\mathrm{~s}, 2 \mathrm{H}), 7.45(\mathrm{~m}, 4 \mathrm{H}), 7.28(\mathrm{~m}, 4 \mathrm{H}), 6.78(\mathrm{~d}$, $J=4.6 \mathrm{~Hz}, 2 \mathrm{H}), 6.74(\mathrm{~s}, 2 \mathrm{H}), 6.61(\mathrm{~d}, J=4.6 \mathrm{~Hz}, 2 \mathrm{H}), 3.79(\mathrm{~s}, 6 \mathrm{H}), 1.82(\mathrm{~s}, 6 \mathrm{H}) .{ }^{13} \mathrm{C}\left\{{ }^{1} \mathrm{H}\right\} \mathrm{NMR}$
(100 MHz, CDCl $_{3}, 25^{\circ} \mathrm{C}$ ) $\delta / \mathrm{ppm}: 168.2,152.8,145.0(\mathrm{~d}, \mathrm{~J}=251.0 \mathrm{~Hz}), 141.9(\mathrm{~d}, \mathrm{~J}=256.4 \mathrm{~Hz})$, $137.5(\mathrm{~d}, \mathrm{~J}=255.6 \mathrm{~Hz}) 136.2,134.1,132.5,131.8,131.5,129.9,129.4,128.4,128.0,123.6$, 117.8, 113.4, $111.9(\mathrm{t}, \mathrm{J}=20.9 \mathrm{~Hz}), 91.7,83.9,61.9,42.1,31.0 .{ }^{19} \mathrm{~F}$ NMR ( $251 \mathrm{MHz}, \mathrm{CDCl}_{3}, 25$ $\left.{ }^{\circ} \mathrm{C}\right) ~ \delta / p p m:-138.3(\mathrm{dd}, \mathrm{J}=10.0,3.8,4 \mathrm{~F}),-151.8(\mathrm{t}, \mathrm{J}=13.8,2 \mathrm{~F}),-160.6(\mathrm{dt}, \mathrm{J}=13.8,3.8,4 \mathrm{~F})$. HR-ESI-MS: $[\mathrm{M}+\mathrm{H}]^{+} \mathrm{m} / \mathrm{z}$ : calcd for $\mathrm{C}_{51} \mathrm{H}_{29} \mathrm{~N}_{4} \mathrm{~F}_{10} \mathrm{O}_{2} \mathrm{Pd}$, 1081.10640; found 1081.11003.

Palladium 2,18-Bis(para\{N,N-dimethyl-amino\}-phenylethynyl)-10,10-dimethyl-5,15dipentafluorophenylbiladiene (Pd[DMBil2-N(CH3)2]): This compound was prepared on a 0.15 mmol scale from $\operatorname{Pd}\left[\mathrm{DMBilBr}_{2}\right]$ and 4-dimethylaminophenylacetylene following the method detailed for Pd[DMBil2-H]. The crude material was purified by column chromatography on silica using $10 \%$ ethyl acetate in hexanes to yield $102 \mathrm{mg}(0.097 \mathrm{mmol})$ of target material as a purple solid in $67 \%$ yield. ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}, 25^{\circ} \mathrm{C}$ ) $\delta / \mathrm{ppm}: 7.56(\mathrm{~s}, 2 \mathrm{H}), 7.34(\mathrm{~d}, \mathrm{~J}=9 \mathrm{~Hz}, 4 \mathrm{H})$, 6.70 (d, J = $4.6 \mathrm{~Hz}, 2 \mathrm{H}), 6.65(\mathrm{~s}, 2 \mathrm{H}), 6.61(\mathrm{~d}, J=9 \mathrm{~Hz}, 4 \mathrm{H}), 6.59(\mathrm{~d}, J=4.6 \mathrm{~Hz}, 2 \mathrm{H}), 2.96(\mathrm{~s}$, $12 \mathrm{H}), 1.82(\mathrm{~s}, 6 \mathrm{H}) .{ }^{13} \mathrm{C}\left\{{ }^{1} \mathrm{H}\right\}$ NMR ( $100 \mathrm{MHz}, \mathrm{CDCl}_{3}, 25^{\circ} \mathrm{C}$ ) $\delta / \mathrm{ppm}: 167.6,153.6,150.0,1465.0$ (d, $J=249.8 \mathrm{~Hz}$ ) , $137.5(\mathrm{~d}, J=256.4 \mathrm{~Hz}), 135.7,134.1,132.8,132.6,131.6,129.3,128.0,117.4$, 114.9, 111.9, 110.3, 93.2, 81.4, 41.9, 40.4, 31.0. ${ }^{19} \mathrm{~F}$ NMR ( $251 \mathrm{MHz}, \mathrm{CDCl}_{3}, 25^{\circ} \mathrm{C}$ ) $\delta / \mathrm{ppm}:-137.8$ (dd, $J=11.3,3.8,4 \mathrm{~F}),-151.6(\mathrm{t}, J=13.8,2 \mathrm{~F}),-160.2(\mathrm{dt}, J=13.8,3.8,4 \mathrm{~F})$. HR-ESI-MS: $[\mathrm{M}+\mathrm{H}]^{+}$ $\mathrm{m} / \mathrm{z}$ : calcd for $\mathrm{C}_{53} \mathrm{H}_{35} \mathrm{~N}_{6} \mathrm{~F}_{10} \mathrm{Pd}$, 1051.17984; found 1051.18292.

Electrochemical Experiments. All cyclic voltammetry (CV) and differential pulse voltammetry (DPV) experiments were performed using a CHI-620D potentiostat and a standard three-electrode setup consisting of a glassy-carbon disk working electrode ( 3.0 mm diameter), a platinum mesh counter electrode, and a leakless $\mathrm{Ag} / \mathrm{AgCl}$ reference electrode (in 3.4 M KCl solution) purchased from eDAQ. Measurements were collected in anhydrous acetonitrile solutions containing 0.1 M TBAPF $_{6}$ as supporting electrolyte. Each of the $\mathbf{P d}[\mathrm{DMBil} 1]$ and $\operatorname{Pd}[D M B i l 2-R]$ derivatives were analyzed at a concentration of 1.0 mM . Solutions were sparged with argon for 20 minutes before data collection was performed while maintining positive pressure of argon over
the electrochemical cell. Freshly sublimed ferrocene was added to the electrolyte solutions at the end of the CV and DPV data collections as an internal standard. All reported potentials are referenced relative to $\mathrm{Fc} / \mathrm{Fc}^{+}$. Reported CV and DPV experiments were carried out at a scan rate of $v=100 \mathrm{mV} \mathrm{s}^{-1}$.

X-ray Structural Analysis. Crystals of Pd[DMBil2-H], Pd[DMBil2-OCH ${ }_{3}$ ], Pd[DMBil2$\mathrm{CF}_{3}$ ]and Pd[DMBil2-CN] were obtained via slow evaporation of saturated solutions of the respective complexes in $50: 50$ mixtures of methanol and $\mathrm{CH}_{2} \mathrm{Cl}_{2}$. Crystals were mounted on plastic mesh using viscous oil and cooled to the data collection temperature. Data were collected on either a Bruker-AXS Apex III DUO CCD diffractometer with graphite monochromated Mo-Ka radiation $(\lambda=0.71073 \AA$ Á) or on a D8 Venture with microfocused Cu-K Ka radiation $(\lambda=1.54178$ Á). Unit cell parameters were obtained from 36 data frames, $0.5^{\circ} \omega$, from different sections of the Ewald sphere or a hemisphere fast scan, $1^{\circ} \omega / \mathrm{s} .{ }^{9}$ The systematic absences from the diffraction data were consistent for Cc and $\mathrm{C} 2 / \mathrm{c}$ for $\mathrm{Pd}[\mathrm{DMBil2}-\mathrm{CN}]$ and $\mathrm{Pd}\left[\mathrm{DMBil2}-\mathrm{OCH}_{3}\right]$, and, uniquely, for $\mathrm{P}_{1} / \mathrm{h}$ for $\mathrm{Pd}\left[\mathrm{DMBil2}-\mathrm{CF}_{3}\right.$ ]. No symmetry higher than triclinic was observed for Pd[DMBil2H]. Solution in the centrosymmetric space group options for $\operatorname{Pd}\left[\mathrm{DMBil2}-\mathrm{OCH}_{3}\right]$ and $\mathrm{Pd}[\mathrm{DMBil2}-$ H ], $\mathrm{C} 2 / \mathrm{c}$ and $P-1$, respectively, yielded chemically reasonable and computationally stable results of refinement. Only the noncentrosymmetric option Cc yielded chemically reasonable results for Pd[DMBil2-CN]. The data were treated with multi-scan absorption corrections. ${ }^{9}$ The structures were solved using intrinsic phasing methods ${ }^{10}$ and refined with full-matrix, least-squares procedures on $F^{2} .{ }^{11}$ Three half molecules of the compound were located in the asymmetric unit of Pd[DMBil2-CN]. Two compound molecules and a toluene molecule of solvation was found in the asymmetric unit of $\operatorname{Pd}\left[\mathrm{DMBil}_{2}-\mathrm{CF}_{3}\right]$. Non-hydrogen atoms were refined with anisotropic displacement parameters. H -atoms were constrained in idealized positions with isotropic parameters based on their attached atoms (1.2-1.5 $U_{\text {eq }}$ ). The penultimate difference maps were treated with Squeeze to model disordered solvent molecules as diffused contributions. ${ }^{12}$ Atomic
scattering factors are contained in the SHELXTL program library. ${ }^{11}$ The structures have been deposited at the Cambridge Structural Database under deposition numbers CCDC 20963412096344.

UV-Visible Absorption Experiments. All UV-visible absorbance spectra were collected at room temperature on a StellarNet CCD array UV-visible spectrometer using quartz cuvettes (6Q) was a 1.0 cm path length from Starna Cells, Inc. Absorption spectra of all species were collected in methanol at concentrations of $3.0,6.0,9.0,12.0$, and $15.0 \mu \mathrm{M}$.

Emission Experiments. Emission spectra were recorded on an automated Photon Technology International (PTI) QuantaMaser 40 fluorometer equipped with a 75 W xenon arc lamp, an LPS-220B lamp power supply, and a Hamamatsu R2658 photomultiplier tube. All samples were prepared in screw cap quartz cuvettes of 1.0 cm path length from Starna Cells, Inc. The samples were excited at $\lambda_{\mathrm{ex}}=500 \mathrm{~nm}$, and emission was monitored from $\lambda_{\mathrm{em}}=515$ to 1000 nm using a step size of 1 nm and an integration time of 0.25 s .

Emission quantum yields were calculated using a solution of $\left[\mathrm{Ru}(\mathrm{bpy})_{3}\right]\left[\mathrm{PF}_{6}\right]_{2}$ in nitrogen saturated acetonitrile as reference and the expression below:

$$
\Phi_{\mathrm{s}}=\Phi_{\mathrm{ref}}\left(\frac{\mathrm{I}_{s}}{\mathrm{I}_{\mathrm{ref}}}\right)\left(\frac{A_{r e f}}{A_{S}}\right)\left(\frac{\eta_{S}}{\eta_{r e f}}\right)^{2}
$$

where $\Phi_{\mathrm{S}}$ and $\Phi_{\text {ref }}$ are the emission quantum yields of the sample and the reference ( $\Phi_{\text {ref }}=0.094$ for $\left[\mathrm{Ru}(\mathrm{bpy})_{3}\right]\left[\mathrm{PF}_{6}\right]_{2}$ in acetonitrile $)^{13,14}$, respectively, $\mathrm{I}_{\mathrm{s}}$ and $\mathrm{I}_{\text {ref }}$ are the integrated emission intensities of the samples and reference, $\mathrm{A}_{\mathrm{s}}$ and $\mathrm{A}_{\text {ref }}$ are the measured absorbances of the sample and reference at the excitation wavelength, and $\eta_{\mathrm{s}}$ and $\eta_{\text {ref }}$ are the refractive indices of the solvents used for the sample and reference.

Singlet Oxygen Sensitization Quantum Yield Determination. ${ }^{1} \mathrm{O}_{2}$ production was quantified by monitoring the fluorescence quenching of 1,3-diphenylisobenzofuran (DPBF), a
previously studied ${ }^{1} \mathrm{O}_{2}$ trapping agent. Measurements were carried out on an automated Photon Technology International (PTI) QuantaMaster 40 fluorometer equipped with a 75-W Xenon arc lamp, an LPS-220B lamp power supply and a Hammamatsu R2658 photomultiplier tube using quartz cuvettes (6Q) of 1.0 cm path length. Each cuvette contained 3.0 mL of methanol solution that was $10.0 \mu \mathrm{M}$ in $\operatorname{Pd}[\mathbf{D M B i l 2 - R}]$ or methylene blue (used as a reference, $\Phi_{D}=0.51$ ) ${ }^{15}$ and 1.0 $\mu \mathrm{M}$ in DPBF. An additional cuvette containing only methanol and $1.0 \mu \mathrm{M}$ DPBF was used as a control. Consumption of DPBF was monitored by observing the change in its integrated emission intensity following irradiation with light from an Intralux 9000 light source (Volpi) fitted with a 10 $\mathrm{nm}(\mathrm{fwhm})$ bandpass filter centered at 600 nm (Thor Labs, FB600-10). During the studies, each cuvette was irradiated for 5 second intervals for a total of 30 seconds. DPBF emission spectra were obtained by exciting at $\lambda_{\mathrm{ex}}=405 \mathrm{~nm}$ and scanning from $\lambda_{\mathrm{em}}=400-600 \mathrm{~nm}$ using a step size of 1 nm and an integration time of 0.25 nm seconds.

Calibration curves of the integrated emission intensity versus the concentration of unreacted DPBF remaining in solution were generated to correct for the absorption of the photosensitizers and standard between $400-600 \mathrm{~nm}$. Emission spectra were collected from 10 $\mu \mathrm{M}$ solutions of $\operatorname{Pd}[\mathrm{DMBil2-R}]$ or methylene blue containing DPBF concentrations of $0.3,0.6$, $0.9,1.2$, and $1.5 \mu \mathrm{M}$. Linear regression lines fit to the calibration data from each solution enabled the integrated emission intensity values obtained from the ${ }^{1} \mathrm{O}_{2}$ sensitization experiments to be converted into the corresponding concentrations of unreacted DPBF. A final plot of the concentration of unreacted DPBF versus irradiation time formed a straight line of slope $m$, which allowed for calculation of the ${ }^{1} \mathrm{O}_{2}$ quantum yields via the following expression:

$$
\Phi_{s}=\Phi_{r e f} \frac{m_{s}}{m_{r e f}} \frac{\varepsilon_{r e f}}{\varepsilon_{s}}
$$

Where $\Phi_{\mathrm{s}}$ and $\Phi_{\text {ref }}$ are the ${ }^{1} \mathrm{O}_{2}$ sensitization quantum yields for the sample and methylene blue reference $\left(51 \%\right.$ in methanol), ${ }^{15}$ respectively, $\mathrm{m}_{\mathrm{s}}$ and $\mathrm{m}_{\text {ref }}$ are the slopes of the concentration of
unreacted DPBF vs. irradiation time plots for the sample and reference, and $\varepsilon_{s}$ and $\varepsilon_{\text {ref }}$ are the extinction coefficients at the wavelength of irradiation (600 nm ) for the sample and reference. All reported ${ }^{1} \mathrm{O}_{2}$ quantum yields were obtained from an average of three trials.
