## Synthetic Procedures

**Scheme 1** Synthetic routes of 2,2'-iminobisbenzaldehyde. (i) conc. H<sub>2</sub>SO<sub>4</sub>, MeOH. (ii) LiAlH<sub>4</sub>, Et<sub>2</sub>O. (iii) MnO<sub>2</sub>, Et<sub>2</sub>O.

### Step i : Synthesis of 2,2'-iminobis(methyl benzoate)

A two-neck round-bottom flask was charged with 2,2'-iminodibenzoic acid (500 mg, 1.94 mmol) and methanol (20 mL), then concentrated H<sub>2</sub>SO<sub>4</sub> (1 mL) was slowly added into. The reaction mixture was refluxed for 5 hours and monitored by thin layer chromatography using 1:4 EtOAc: Hexane as a solvent system. After removal of methanol, the reaction was then cautiously added 10 mL of Na<sub>2</sub>CO<sub>3</sub> (2.40 g). (Note: the CO<sub>2</sub> bubbling occurs upon the addition of Na<sub>2</sub>CO<sub>3</sub>). After the bubbling subsides, the solution was extracted with 5 mL of 15% NaCl, followed by CH<sub>2</sub>Cl<sub>2</sub> (3 x 10 mL). The combined organic layer was then washed with 10 mL of saturated NaCl, after which the CH<sub>2</sub>Cl<sub>2</sub> was removed by reduced pressure to afford the pale-yellow solid as the desired product (477 mg, 86%). <sup>1</sup>H NMR (400 MHz, CDCl<sub>3</sub>, 298 K): δ(ppm) = 3.94 (s, 6H, CH<sub>3</sub>), 6.90 (t, *J* = 7.5 Hz, 2H, ArH), 7.37 (t, *J* = 7.3 Hz, 2H, ArH), 7.55 (d, *J* = 8.5 Hz, 2H, ArH), 7.99 (d, *J* = 6.9 Hz, 2H, ArH), 11.05 (s, 1H, NH).

### Step ii : Synthesis of 2,2'-iminobis(hydroxymethyl benzene)

To a suspension of LiAlH<sub>4</sub> (151 mg, 3.97 mmol) in anhydrous Et<sub>2</sub>O (40 mL) was cautiously added 2,2'-iminobis(methyl benzoate) (453 mg, 1.59 mmol) over a 15 minute period. The resulting mixture was stirred overnight, after which was quenched sequentially in ice bath by ethyl acetate (3 mL), water (3 mL), NaOH (3 mL, 15%) and water (20 mL), and then filtered. The precipitate was extracted with boiling chloroform (3 x 10 mL). The solvent was removed under reduced pressure, resulting the crude off-white solid which was then purified by precipitating in CH<sub>2</sub>Cl<sub>2</sub>/Hexane to afford the white solid (255 mg, 70%). <sup>1</sup>H NMR (400 MHz, DMSO-*d*<sub>6</sub>, 298 K): δ(ppm) = 4.48 (d, *J* = 5.0 Hz, 4H, CH<sub>2</sub>), 5.26 (t, *J* = 5.1 Hz, 2H, OH), 6.87 (t, *J* = 7.2 Hz, 2H, ArH), 7.04 (d, *J* = 7.9 Hz, 2H, ArH), 7.15 (t, *J* = 7.4 Hz, 2H, ArH), 7.31 (d, *J* = 7.3 Hz, 2H, ArH), 7.40 (s, 1H, NH).

### Step iii: Synthesis of 2,2'-iminobisbenzaldehyde

To a colourless solution of 2,2'-iminobis(hydroxymethyl benzene) (230 mg, 1.00 mmol) in dry Et<sub>2</sub>O (30 mL) was added an activated MnO<sub>2</sub> (1.75 g, 20.13 mmol). The resulting black suspension was stirred at room temperature overnight. The MnO<sub>2</sub> was then filtered off and extracted with boiling chloroform (3 x 10 mL). The combined extracts and filtrate were concentrated to yield a yellow solid. This crude yellow solid was purified by chromatography on silica gel with 1:4 EtOAc: Hexane (R<sub>f</sub> = 0.4), giving the title product as a bright yellow crystalline solid (138 mg, 62%). <sup>1</sup>H NMR (400 MHz, CDCl<sub>3</sub>, 298 K): δ(ppm) = 7.08 (t, *J* = 7.3 Hz, 2H, ArH), 7.47 (t, *J* = 7.6 Hz, 2H, ArH), 7.55 (d, *J* = 8.0 Hz, ArH), 7.71 (d, *J* = 7.7 Hz, 2H, ArH), 10.03 (s, 2H, CHO), 11.36 (s, 1H, NH).

## Electrochemical Studies in Non-aqueous Electrolyte

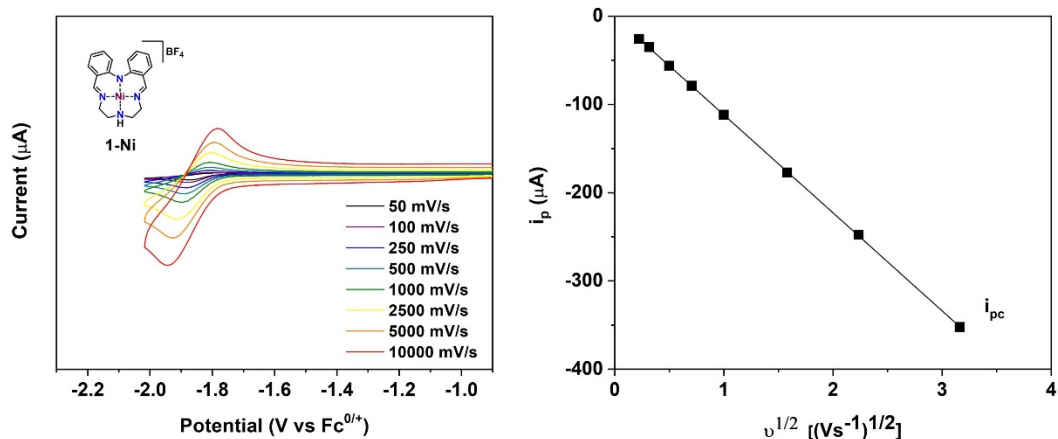

**Fig. S10** CVs of 1 mM (a) 1-Ni, (b) 2-Ni and (c)  $[2-Ni]^{Me}$  recorded in  $N_2$ -saturated  $CH_3CN/0.1 M Bu_4NPF_6$  solution ( $v = 0.1 V/s$ , glassy carbon electrode).

**Table S1** Electrochemical data of Schiff base nickel macrocycles. <sup>[a]</sup>

Complex	$E_{pc1}$ (V)	$E_{pa1}$ (V)	$E_{1/2}$ (V) <sup>[b]</sup> [ $\Delta E_p$ (mV)] <sup>[c]</sup>	$E_{pc2}$ (V)	$E_{pa2}$ (V)	$E_{1/2}$ (V) <sup>[b]</sup> [ $\Delta E_p$ (mV)] <sup>[c]</sup>
1-Ni	+0.45	+0.52	+0.49 [73]	-1.89	-1.82	-1.86 [80]
2-Ni	+0.25	+0.33	+0.29 [82]	-1.75	-1.68	-1.72 [71]
$[2-Ni]^{Me}$	+0.27	+0.34	+0.31 [76]	-1.56	-1.49	-1.52 [66]

<sup>[a]</sup> All voltammograms were recorded in  $CH_3CN$ ; the potentials are reported vs. the  $Fc^{+/0}$  couple. Conditions: scan rate = 100 mV/s, compound (1 mM),  $Bu_4NPF_6$  (0.1 M), glassy carbon working electrode. Under these conditions we found  $\Delta E_p (Fc^{+/0}) = 65 mV$ . <sup>[b]</sup>  $E_{1/2} = (E_{pc} + E_{pa})/2$ , when  $E_{pc}$  = cathodic peak potential and  $E_{pa}$  = anodic peak potential. <sup>[c]</sup>  $\Delta E_p = |E_{pc} - E_{pa}|$ .

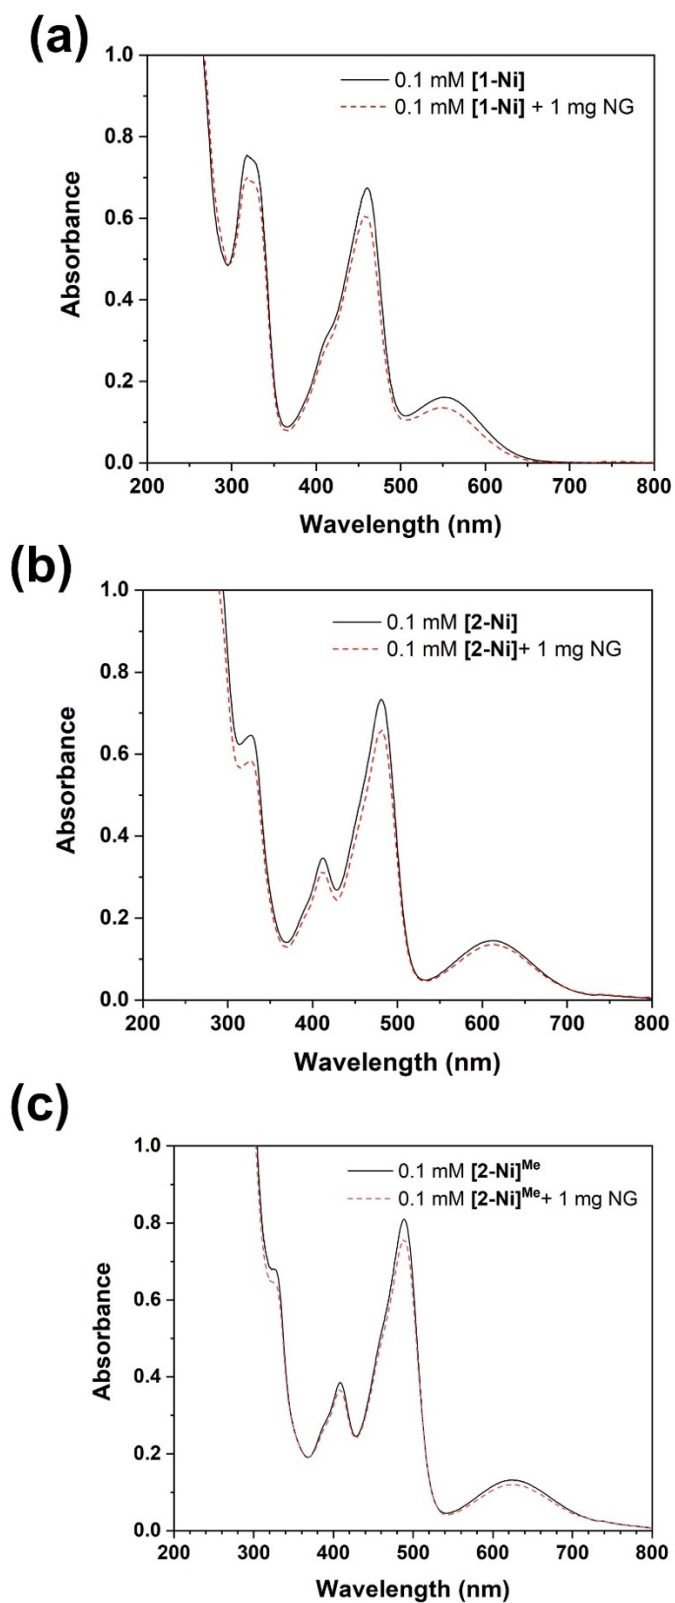

**Fig. S14** Cyclic voltammograms of (a) **1-Ni**, (b) **2-Ni**, and (c) **[2-Ni]<sup>Me</sup>** at 1 mM concentration in 0.1 M  $\text{NBu}_4\text{PF}_6/\text{CH}_3\text{CN}$  ( $v = 0.1 \text{ V/s}$ ) under  $\text{N}_2$  (blue) and under  $\text{N}_2$  with 1 M  $\text{H}_2\text{O}$  (pink). Background signals were collected under  $\text{CO}_2$ -saturated 0.1 M  $\text{NBu}_4\text{PF}_6/\text{CH}_3\text{CN}$  and illustrated in black-dashed line.

**Fig. S15** Cyclic voltammograms (CVs) of (a) 1-Ni, (b) 2-Ni and (c) [2-Ni]<sup>Me</sup> in CO<sub>2</sub>-saturated CH<sub>3</sub>CN/ 0.1 M Bu<sub>4</sub>NPF<sub>6</sub> with the various concentration of H<sub>2</sub>O. CVs in N<sub>2</sub>-saturated CH<sub>3</sub>CN/ 0.1 M Bu<sub>4</sub>NPF<sub>6</sub> were illustrated in the broken line. Glassy carbon (Area = 0.071 cm<sup>2</sup>) was used as a working electrode.

## UV-visible Spectra of Ni Complexes Before and After Adsorption on NG

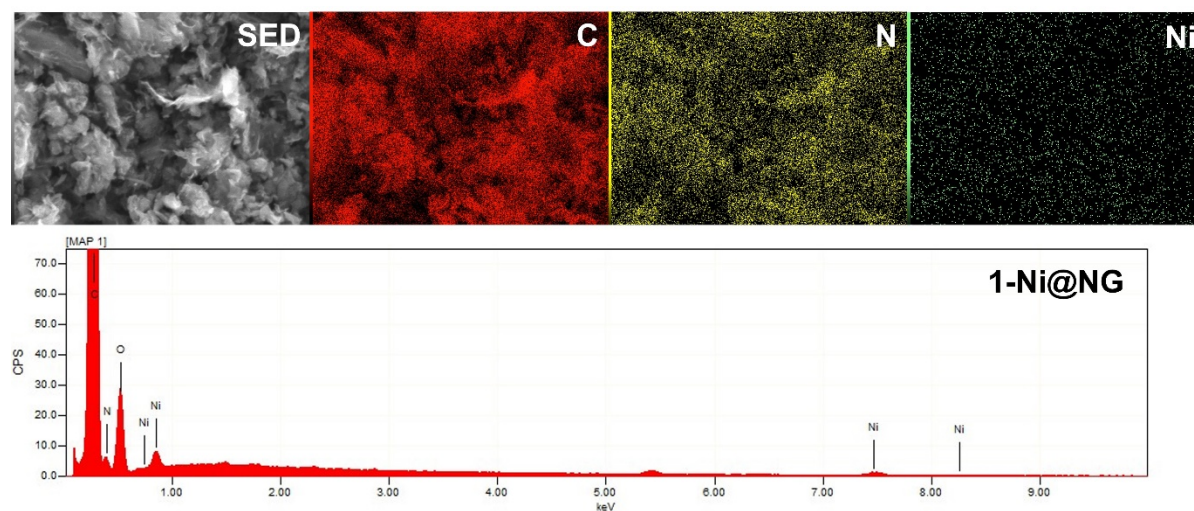

**Fig. S16** UV-visible spectra of (a) **1-Ni**, (b) **2-Ni** and (c) **[2-Ni]<sup>Me</sup>** complexes before (black solid line) and after (red dotted line) adsorption on NG.

## Scanning Electron Microscopic Images

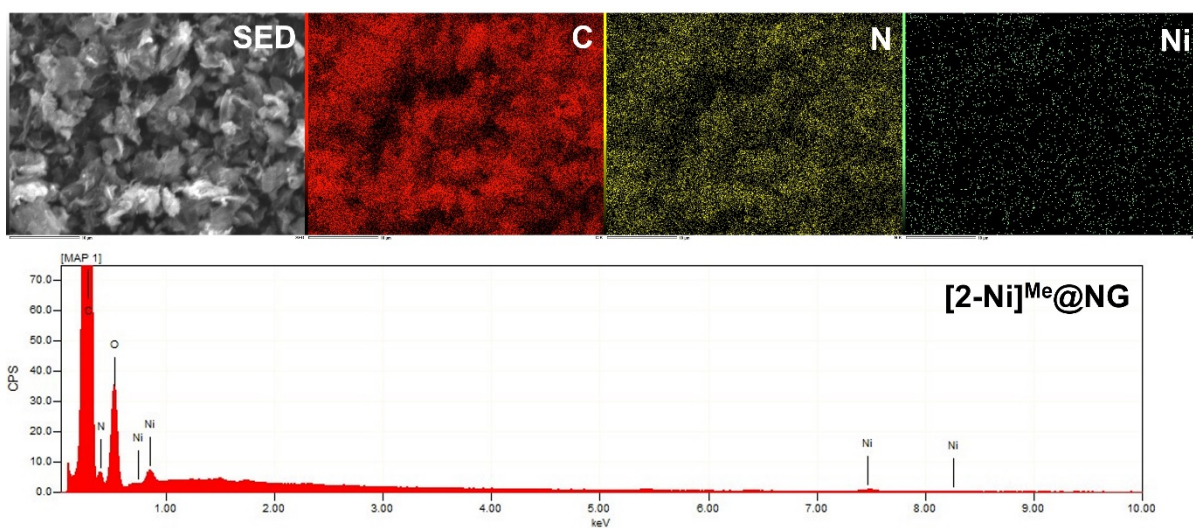

**Fig. S17** Scanning electron microscopy (SEM) image of N-doped graphene at 1000-fold magnification and energy dispersive X-ray spectrum (EDS) of NG.

**Fig. S18** 3000-fold-magnified SEM images coupled with elemental mapping of 1-Ni@NG. C (red), N (yellow), Ni (green). EDS spectrum of 1-Ni@NG.

**Fig. S19** 3000-fold-magnified SEM images coupled with elemental mapping of **2-Ni@NG**. C (red), N (yellow), Ni (green). EDS spectrum of **2-Ni@NG**.

**Fig. S20** 3000-fold-magnified SEM images coupled with elemental mapping of **[2-Ni]<sup>Me</sup>@NG**. C (red), N (yellow), Ni (green). EDS spectrum of **[2-Ni]<sup>Me</sup>@NG**.

**Fig. S21** (a) Scanning electron microscopic (SEM) image of pristine CNT and elemental mapping (C = red, O = dark green, Si = light green, Al = orange). (b) Energy dispersive X-ray spectroscopy (EDS) of pristine CNT. Silicon wafer was used as a holder for sample preparation.

**Fig. S22** (a) Scanning electron microscopic (SEM) image of 1-Ni@CNT and elemental mapping (C = red, O = dark green, Si = light green, Al = orange). (b) Energy dispersive X-ray spectroscopy (EDS) of 1-Ni@CNT. Silicon wafer was used as a holder for sample preparation.

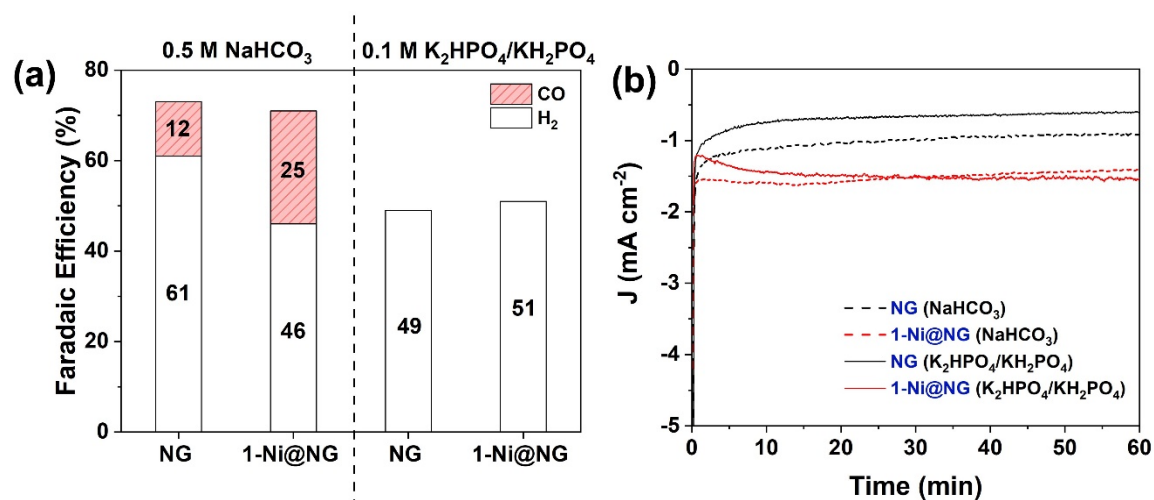

**Fig. S23** (a) Transmission electron microscopic (TEM) image of **1-Ni@CNT**. (b) Energy dispersive X-ray spectroscopy (EDS) of **1-Ni@CNT**. Cu grid was used as a holder for sample preparation.

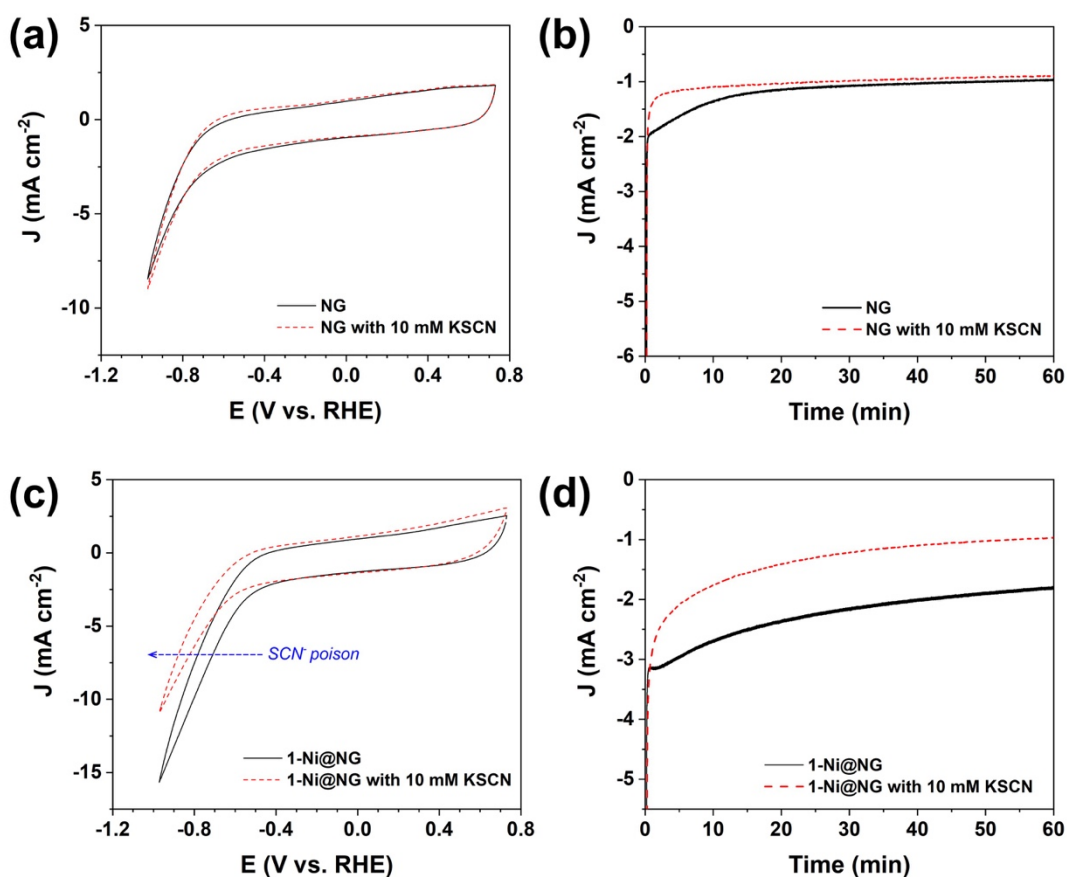

## Electrochemical Studies in Aqueous Electrolyte

**Fig. S24** (a) Cyclic voltammograms of CNT and **1-Ni@CNT** in 0.5 M NaHCO<sub>3</sub>. (b) Chronoamperometric measurement of CNT and **1-Ni@CNT** in CO<sub>2</sub>-saturated 0.5 M NaHCO<sub>3</sub> (pH = 7.3) for 1 h. (c) Faradaic efficiency of CNT and **1-Ni@CNT** showing only H<sub>2</sub> was observed during the bulk electrolysis.

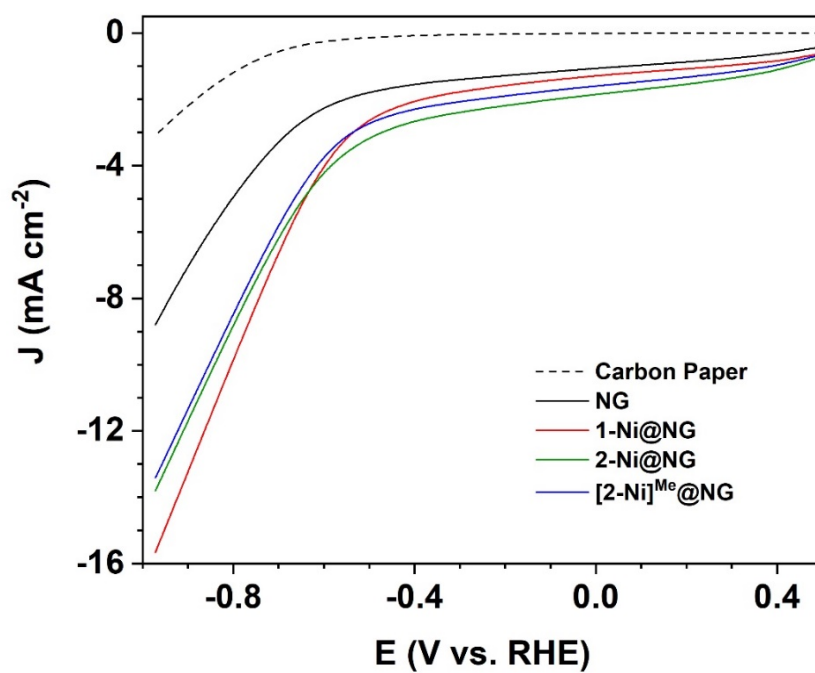

**Fig. S25** (a) Faradaic efficiencies and (b) current-time profiles for 1 h-controlled potential electrolysis at  $-0.67$  V vs. RHE in N<sub>2</sub>-saturated 0.1 M K<sub>2</sub>HPO<sub>4</sub>/KH<sub>2</sub>PO<sub>4</sub> (pH 8.1) of NG (black solid line) and **1-Ni@NG** (red solid line) versus in N<sub>2</sub>-saturated 0.5 M NaHCO<sub>3</sub> (pH 8.7) of **NG** (black dotted line) and **1-Ni@NG** (red dotted line).

**Fig. S26** KSCN poisoning test. (a) and (c) Cyclic voltammograms of NG and **1-Ni@NG** with and without 10 mM KSCN in 0.5 M NaHCO<sub>3</sub>. (b) and (d) Current-time profiles of **NG** and **1-Ni@NG** with (red trace) and without (black trace) 10 mM KSCN in 0.5 M NaHCO<sub>3</sub>.

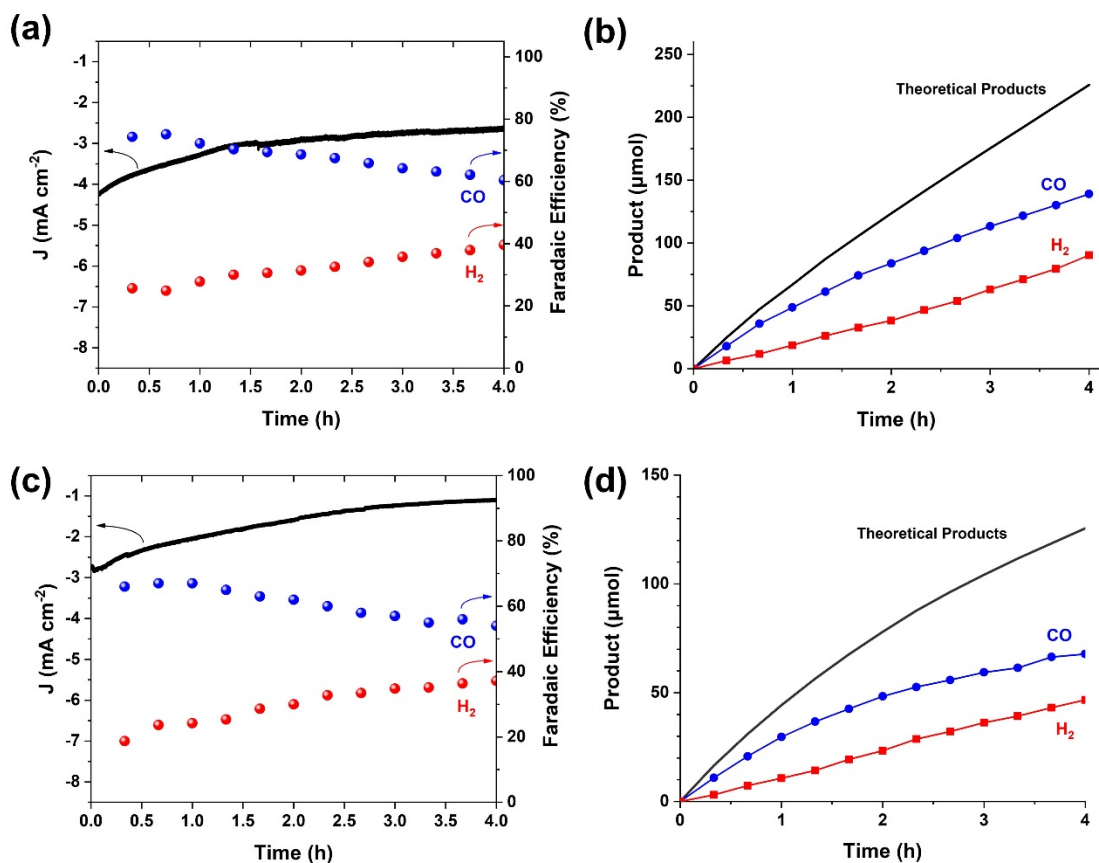

**Table S8** Electrochemical CO<sub>2</sub> reduction in the presence and absence of 10 mM KSCN at -0.67 V vs. RHE for 1 h

Catalysts	[KSCN]	Average Current Density (mA cm <sup>-2</sup> )	%FE(CO)	CO (μmol)
NG	0 mM	1.1	22	4.5
	10 mM	1.0	21	4.1
1-Ni@NG	0 mM	2.2	81	37.8
	10 mM	1.4	68	17.6

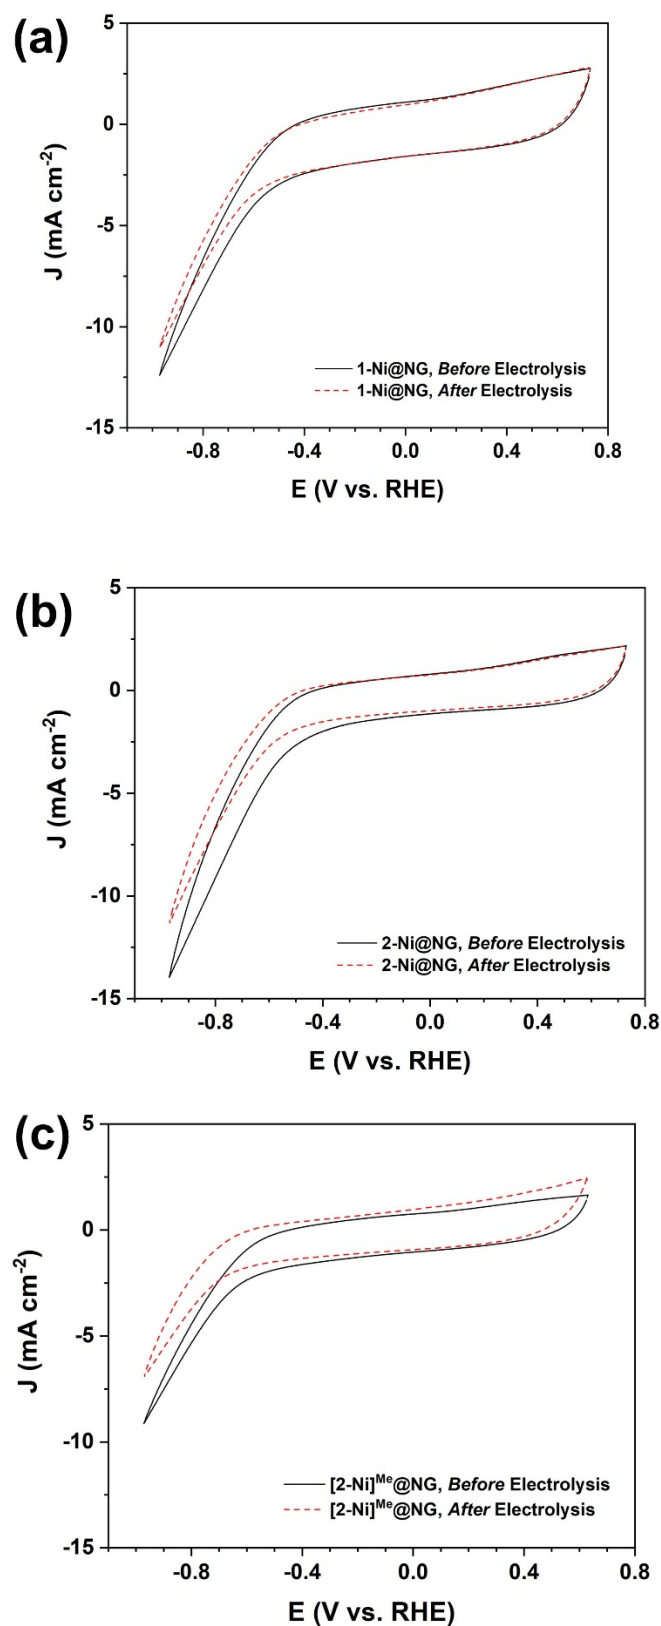

**Fig. S27** Linear sweep voltammetry (LSV) in CO<sub>2</sub>-saturated 0.5 M NaHCO<sub>3</sub> for carbon paper (black dotted line), NG (black solid line), **1-Ni@NG** (red solid line), **2-Ni@NG** (green solid line), and **[2-Ni]<sup>Me</sup>@NG** (blue solid line) at the scan rate of 0.05 V/s.

**Fig. S28** Current-density time profiles and faradaic efficiencies of CO (blue) and H<sub>2</sub> (red) evolution in controlled potential electrolysis at -0.67 V vs. RHE ( $\eta = 0.56$  V) in CO<sub>2</sub>-saturated 0.5 M NaHCO<sub>3</sub> using (a) 2-Ni@NG and (b) [2-Ni]<sup>Me</sup>@NG. Time courses of the moles of CO (blue) and H<sub>2</sub> (red) production from bulk electrolysis and theoretical product yields (black) calculated from  $e^-/2$  of charge required during the bulk electrolysis for (c) 2-Ni@NG and (d) [2-Ni]<sup>Me</sup>@NG.

**Fig. S29** Cyclic voltammetry in CO<sub>2</sub>-saturated 0.5 M NaHCO<sub>3</sub> before (black solid line) and after electrolysis (red-dotted line) at -0.67 V vs. RHE for 4 h for (a) **1-Ni@NG**, (b) **2-Ni@NG** and (c) **[2-Ni]<sup>Me</sup>@NG**.

**1-Ni@NG/CP Before Electrolysis**

**1-Ni@NG/CP After Electrolysis**

**2-Ni@NG/CP Before Electrolysis**

**2-Ni@NG/CP After Electrolysis**

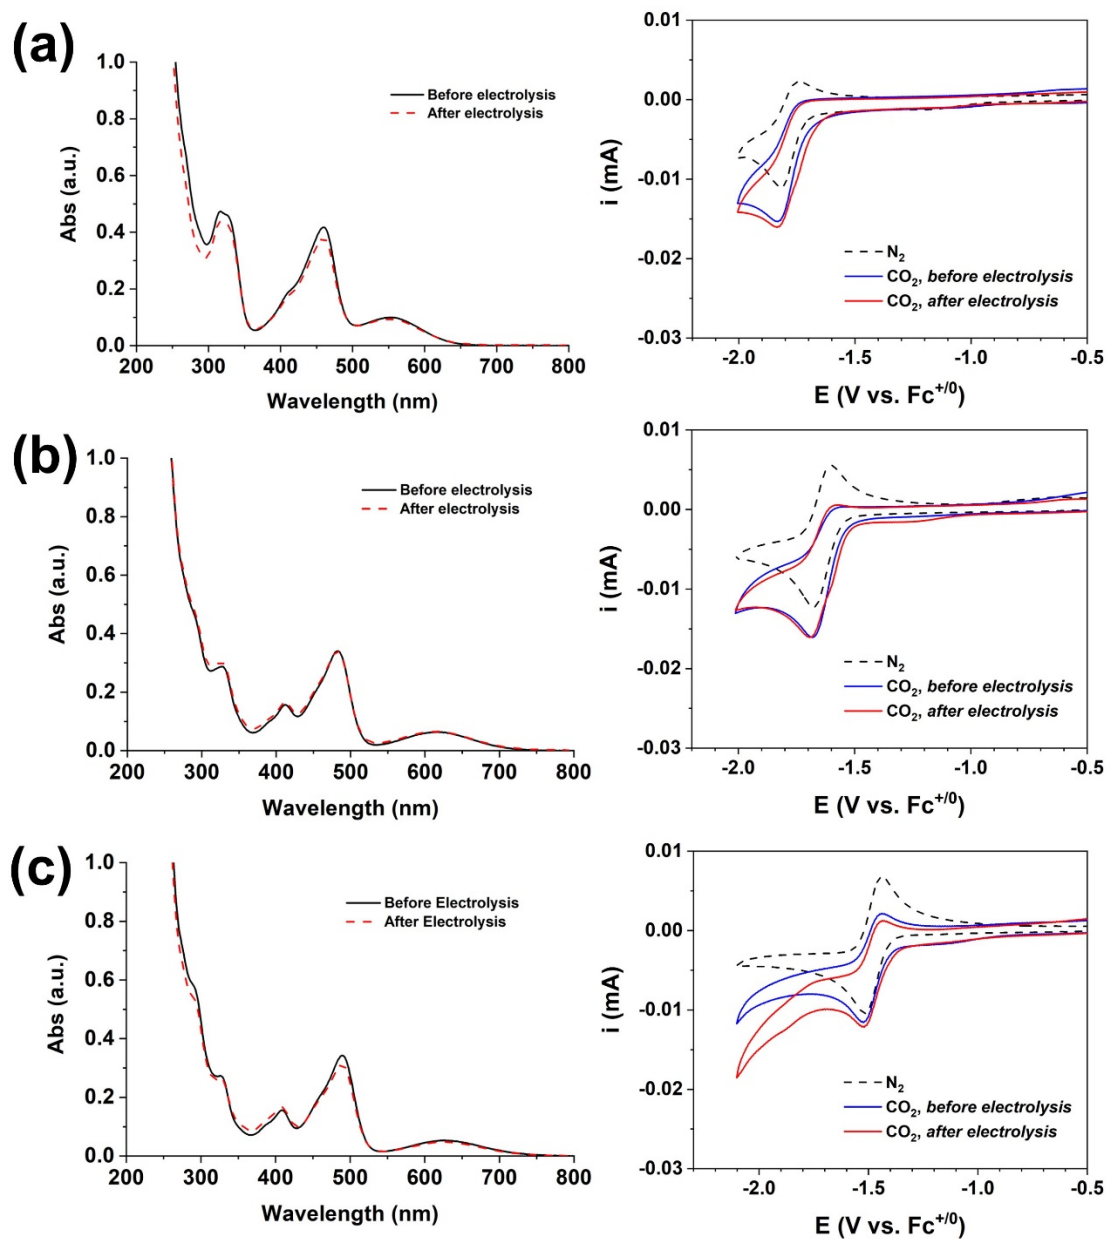

**[2-Ni]<sup>Me</sup>@NG/CP Before Electrolysis**

**[2-Ni]<sup>Me</sup>@NG/CP After Electrolysis**

**Fig. S30** SEM images at 2000-fold magnification of **1-Ni@NG/CP**, **2-Ni@NG/CP** and **[2-Ni]<sup>Me</sup>@NG/CP** before and after electrocatalysis for 4 h at the applied potential of -0.67 V vs. RHE.

**Fig. S31** UV-visible spectroscopy (left panel) and cyclic voltammograms (right panel) of (a) 1-Ni, (b) 2-Ni and (c) 2-Ni<sup>Me</sup> before and after electrolysis at E = -1.85, -1.75 and -1.65 V vs. Fc<sup>+0</sup> in CO<sub>2</sub>-saturated 0.1 M N<sub>4</sub>BuPF<sub>6</sub>/CH<sub>3</sub>CN.

**Fig. S32** A two-compartment three-electrode electrochemical setup for aqueous system.

**Fig. S33** GC traces of bulk electrolysis using NG (black) and 1-Ni@NG (blue) in 0.5 M NaHCO<sub>3</sub> at E = -0.77 V vs. RHE for 1 h. Retention time of H<sub>2</sub> (0.617), O<sub>2</sub> (0.694), N<sub>2</sub> (0.869), CO (2.010) and CO<sub>2</sub> (4.023). The carrier gas was He and the detector was a thermal conductivity detector (TCD).

## Calculation of Faradaic Efficiency

$$\% \text{Faradaic Efficiency} = \frac{Q_{\text{output}}}{Q_{\text{input}}} \times 100$$

where  $e_{\text{input}}$  = the total number of moles of electrons measured during electrolysis

$e_{\text{output}}$  = the number of moles of electrons required for reducing  $\text{CO}_2$  to CO

For bulk electrolysis at  $E = -0.77 \text{ V vs. RHE}$

$$e_{\text{input}} = \frac{Q}{F} = \frac{\int i dt}{F} = \frac{11.60 \text{ C}}{96485 \frac{\text{C}}{\text{mole of electrons}}} = 1.20 \times 10^{-4} \text{ mole of electrons}$$

### Calculation of Faradaic Efficiency of CO

Volume of measured CO from GC = 4.42%, which was calibrated from standard gas

Head space of H-type cell = 28 mL

Hence, volume of CO produced = 28 mL  $\times$  0.0442 = 1.24 mL

Conversion of volume to mole of produced CO

From the law of ideal gases,

$$PV = nRT$$

$$n = PV/RT$$

$$n = (1 \text{ atm})(1.24 \times 10^{-3} \text{ L}) / (0.0821 \text{ L atm mol}^{-1} \text{ K}^{-1})(298.15 \text{ K})$$

Thus, moles of produced CO

$$n_{\text{CO}} = 5.07 \times 10^{-5} \text{ mol}$$

**Electrochemical  $\text{CO}_2$ -to-CO conversion:**  $\text{CO}_2 + 2\text{H}^+ + 2\text{e}^- \rightarrow \text{CO} + \text{H}_2\text{O}$

$$e_{\text{output}} = 5.07 \times 10^{-5} \text{ mol of CO} \times \frac{2 \text{ mol of electrons}}{1 \text{ mol of CO}} = 1.01 \times 10^{-4} \text{ mol of electrons}$$

$$\text{Hence, \%Faradaic Efficiency of CO} = \frac{e_{\text{output}}}{e_{\text{input}}} \times 100 = \frac{1.01 \times 10^{-4} \text{ mol of electrons}}{1.20 \times 10^{-4} \text{ mol of electrons}} \times 100 = 84.2\%$$

## Calculation of Faradaic Efficiency of H<sub>2</sub>

Volume of measured H<sub>2</sub> from GC = 0.87%, which was calibrated from standard gas

Head space of H-type cell = 28 mL

Hence, volume of produced H<sub>2</sub> = 28 mL x 0.0087 = 0.24 mL

Conversion of volume to mole of produced H<sub>2</sub>

From the law of ideal gases,  $PV = nRT$

$$n = PV/RT$$

$$n = (1 \text{ atm})(0.24 \times 10^{-3} \text{ L}) / (0.0821 \text{ L atm mol}^{-1} \text{ K}^{-1})(298.15 \text{ K})$$

Thus, moles of produced H<sub>2</sub>  $n_{\text{H}_2} = \underline{0.98 \times 10^{-5} \text{ mol}}$

**Hydrogen Evolution Reaction (HER):**  $2\text{H}^+ + 2\text{e}^- \rightarrow \text{H}_2$

$$e_{\text{output}} = 0.98 \times 10^{-5} \text{ mol of H}_2 \times \frac{2 \text{ mol of electrons}}{1 \text{ mol of CO}} = 1.96 \times 10^{-5} \text{ mol of electrons}$$

$$\text{Hence, \%Faradaic Efficiency of H}_2 = \frac{e_{\text{output}}}{e_{\text{input}}} \times 100 = \frac{1.96 \times 10^{-5} \text{ mol of electrons}}{1.20 \times 10^{-4} \text{ mol of electrons}} \times 100 = 16.3\%$$

## Summarized Data of Bulk Electrolysis at Various Potential Applied
