Theoretical calculations

All theoretical calculations were pursued with the ORCA 5.0.3 package.^{S32-S34} The state average complete active space self-consistent field (SA-CASSCF) was used to calculate the zero-field splitting and g-factors for Co(II)-SIMs. The CASSCF wave functions were complemented by the N-electron valence second order perturbation theory (NEVPT2) with CAS(7,5) active spaces.^{S35,S36} In the state averaged approach all multiplets for the given electron configuration were equally weighted, which means 10 quartet and 40 doublet states. The ZFS parameters were calculated through

the quasi-degenerate perturbation theory (QDPT),^{S37} in which approximations to the Breit-Pauli form of the spin-orbit coupling operator (RI-SOMF approximation)^{S38} and the effective Hamiltonian theory were utilized.^{S39} The def2-TZVP(-f) basis set S6 was used for all calculations, assisted by the autoaux basis set in the RI calculations,^{S36} and the chain-of-spheres (RIJCOSX) approximation to exact exchange.^{S40} Additionally, Local spin-Hamiltonian parameters g-factors have been computed by using the SINGLE_ANISO module from the EHA method.^{S41}

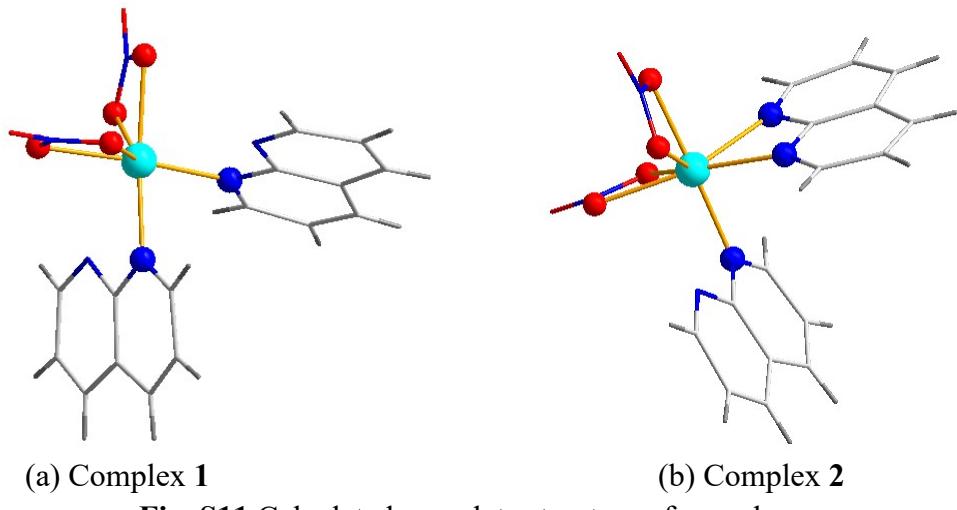

Fig. S11 Calculated complete structure of complexes.

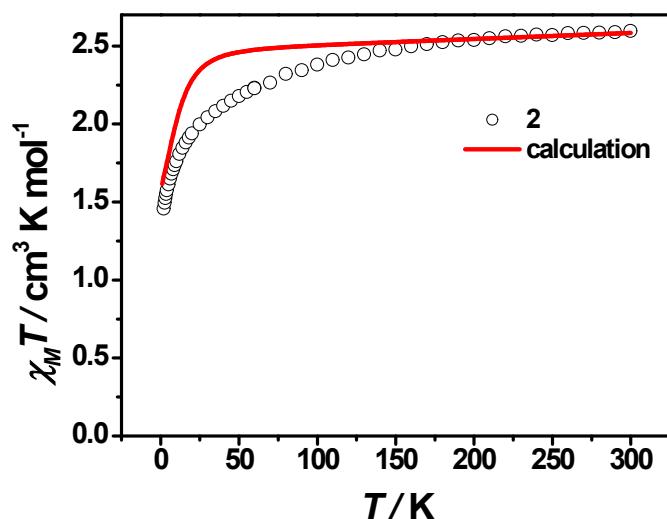

Fig. S12 Calculated (red solid line) data of magnetic susceptibilities of **2**.

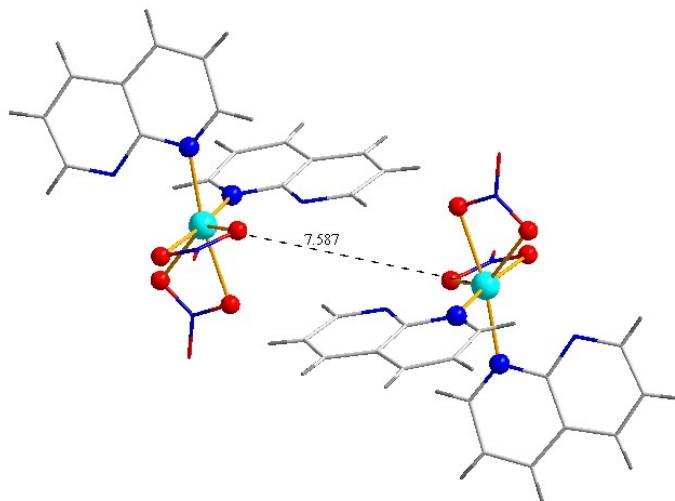

Fig. S13 The nearest fragment diagram for complex 1.

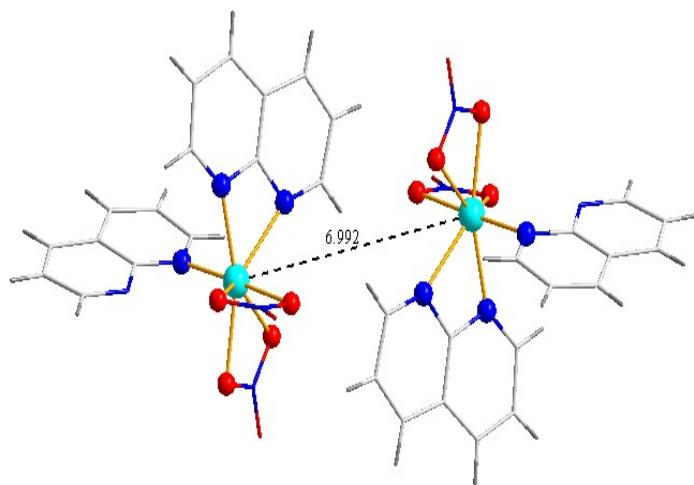

Fig. S14 The nearest fragment diagram for complex 2.

The magnetic coupling constants were obtained by calculating the energy gap between the high spin state (E_{HS} , $|+3/2,+3/2\rangle$) and the broken symmetry state (E_{BS} , $|+3/2,-3/2\rangle$) at the B3LYP-D4/def2-TZVP(-f) level of theory,^{S42,S43} that the density functional theory and the broken-symmetry state method (DFT-BS) was proposed by Noddleman. The magnetic coupling constant between two nearest neighbor Co-SIMs segments can be obtained using the HDVV Hamiltonian description:

$$\hat{H} = -2J\hat{S}_1 \cdot \hat{S}_2 \quad (2)$$

Where J is the magnetic coupling constant between Co(II) ions, and \hat{S}_1 and \hat{S}_2 are the respective spin operators representing Co(1) and Co(2) at this center.^{S44}

The magnetic coupling constant between two nearest neighbor Co-SIMs segments

was evaluated using the formula proposed by Yamaguchi *et al.*^{S45}

$$J = -\frac{E_{HS} - E_{BS}}{S_{HS}^2 - S_{BS}^2} \quad (3)$$

where S_{HS}^2 and S_{BS}^2 represents the expectation value of the square of the spin operator for the HS state and the BS state, respectively.

Table S9. Calculated energies of HS and BS states (E_{HS} and E_{BS}) and magnetic coupling constants (J_{calc}) of complexes at the B3LYP-D4/def2-TZVP(-f) level of theory.

Co-SIMs segments	E_{HS}/eV	E_{BS}/eV	S_{HS}^2	S_{BS}^2	$J_{\text{calc}}/\text{cm}^{-1}$
1-the nearest distance	-151235.24904	-151235.24904	12.01669	3.01669	0.00
2-the nearest distance	-151239.20967	-151239.20967	12.01882	3.01882	0.00

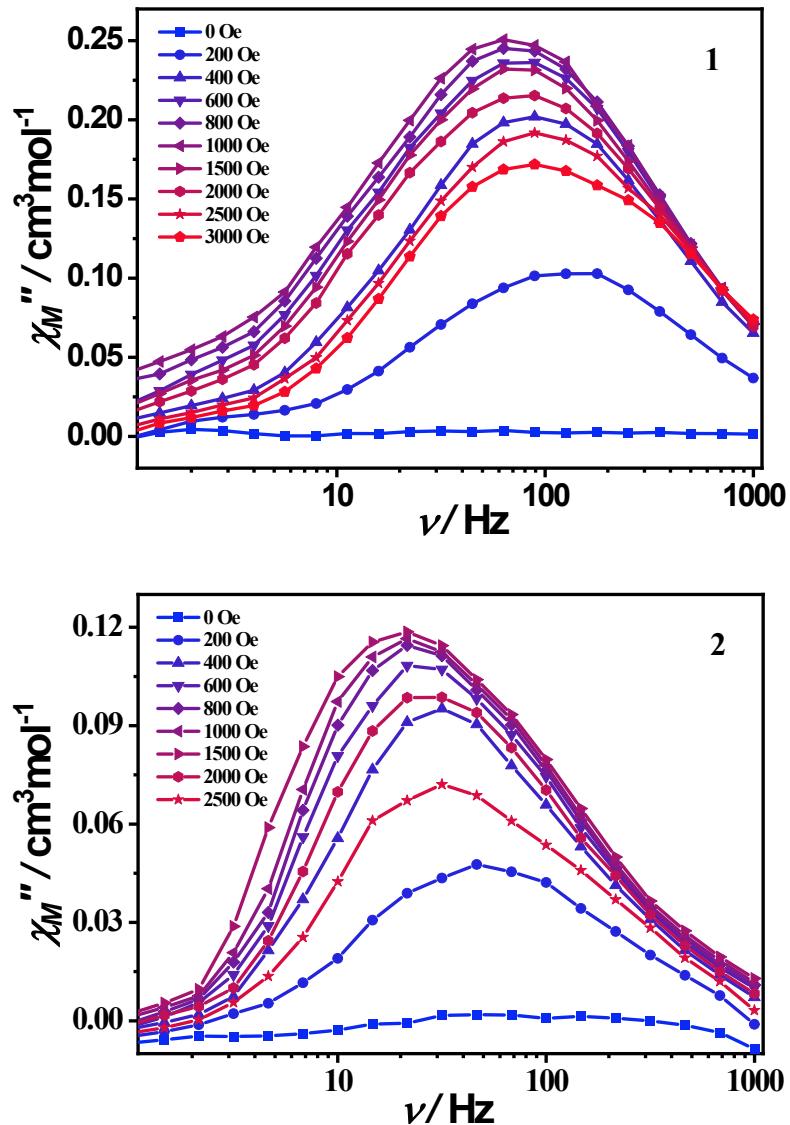

Fig. S15 Frequency dependence of out-of-phase (χ_M'') ac susceptibility at 1.8 K under the different applied static fields for **1** and **2**. The solid lines are for eye guide.

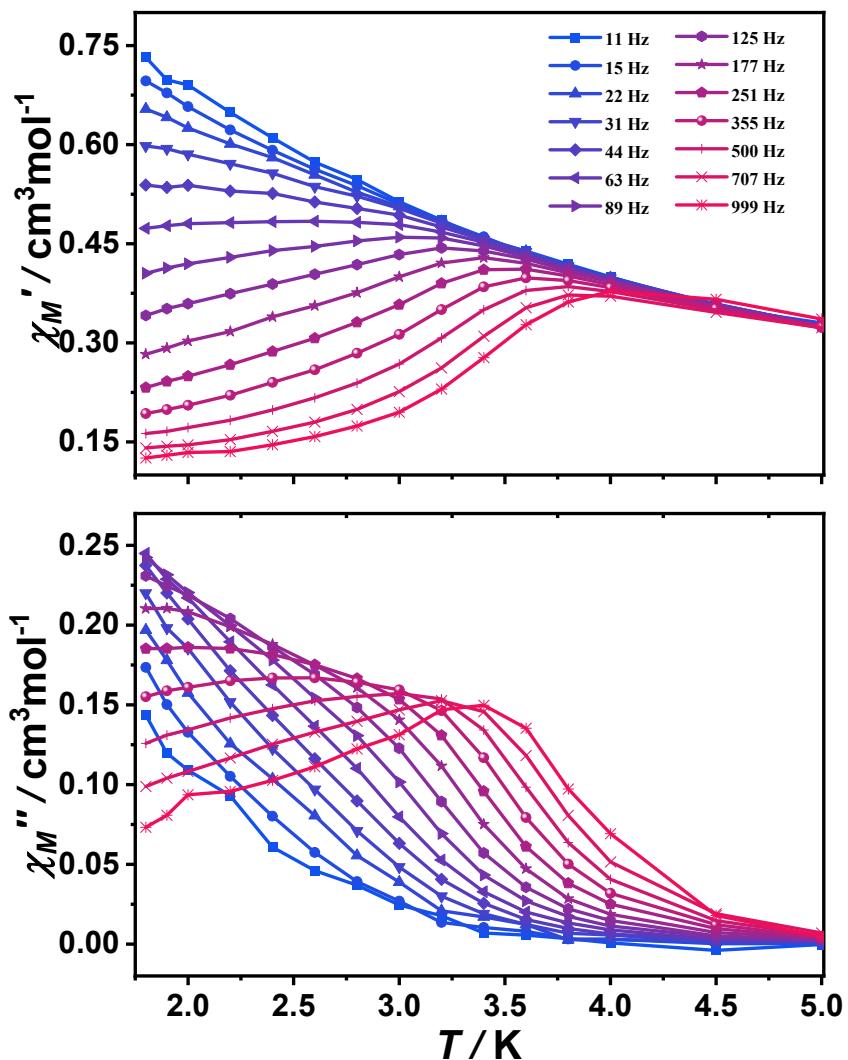

Fig. S16 Temperature dependence of in-of-phase (χ_M') and out-of-phase ac susceptibility (χ_M'') at different ac frequencies under 1000 dc field for **1**. The solid lines are for eye guide.

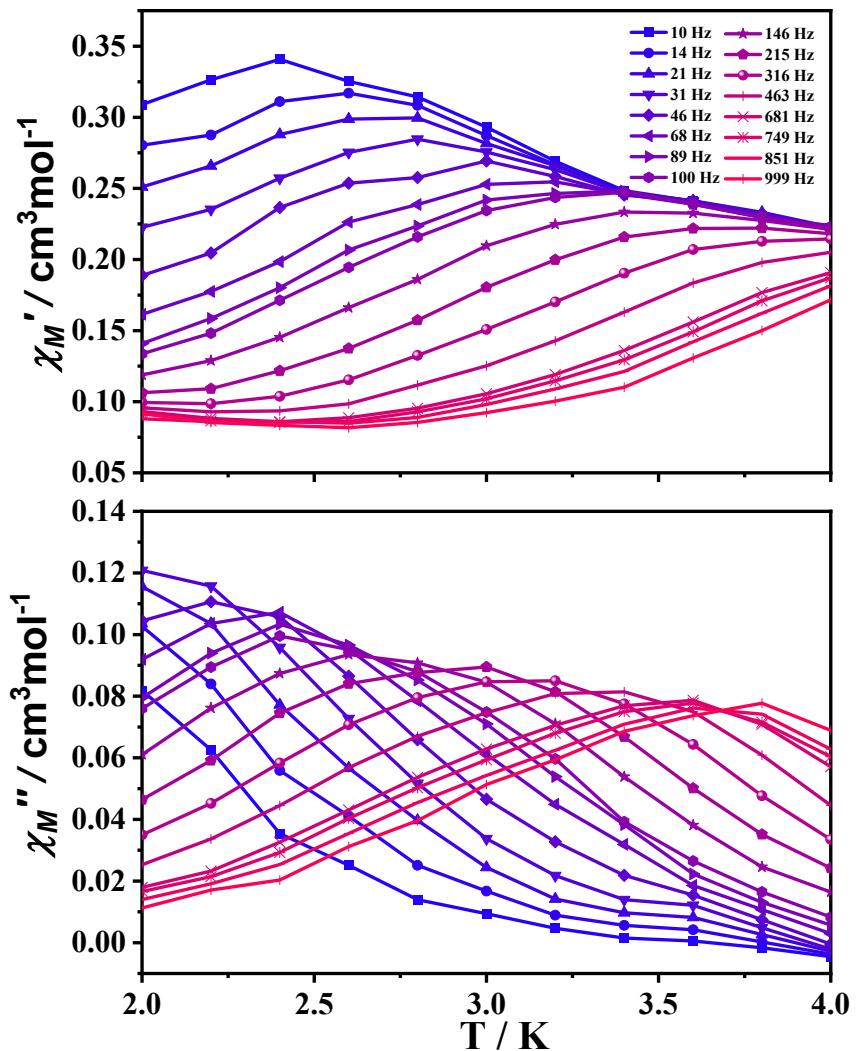

Fig. S17 Temperature dependence of in-of-phase (χ_M') and out-of-phase ac susceptibility (χ_M'') at different ac frequencies under 1500 Oe dc field for **2**. The solid lines are for eye guide.

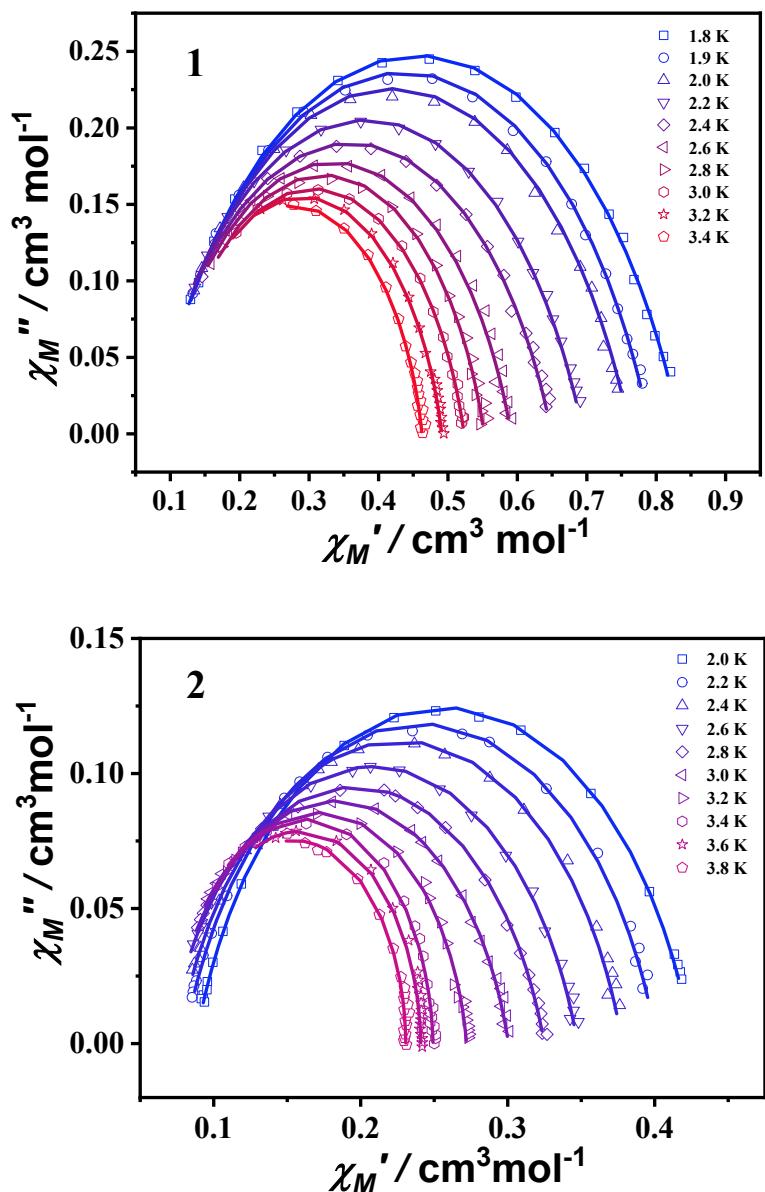

Fig. S18 Cole-Cole plot obtained from the ac susceptibility data under a different range of temperature for **1** and **2**. Solid lines represent the best fits to a generalized Debye model.^{S46}

Table S10. Relaxation times τ (s) and α values for 1.

1				
T (K)	χ_s	χ_T	τ (s)	α
1.8	0.077	0.83	0.23×10^{-2}	0.27
1.9	0.078	0.79	0.20×10^{-2}	0.26
2.0	0.074	0.76	0.18×10^{-2}	0.26
2.2	0.070	0.70	0.13×10^{-2}	0.26
2.4	0.070	0.66	0.10×10^{-2}	0.26
2.6	0.071	0.60	0.78×10^{-3}	0.25
2.8	0.076	0.56	0.58×10^{-3}	0.23
3.0	0.089	0.52	0.42×10^{-3}	0.19
3.2	0.091	0.49	0.27×10^{-3}	0.16
3.4	0.085	0.46	0.17×10^{-3}	0.15

Table S11. Relaxation times τ (s) and α values for 2.

2				
T (K)	χ_s	χ_T	τ (s)	α
2.0	0.087	0.43	6.82×10^{-3}	0.19
2.2	0.080	0.40	4.64×10^{-3}	0.19
2.4	0.075	0.38	2.93×10^{-3}	0.19
2.6	0.069	0.35	1.80×10^{-3}	0.19
2.8	0.067	0.32	1.19×10^{-3}	0.19
3.0	0.066	0.30	7.55×10^{-4}	0.17
3.2	0.071	0.27	5.04×10^{-4}	0.10
3.4	0.075	0.25	3.36×10^{-4}	0.031
3.6	0.077	0.24	2.43×10^{-4}	0.025
3.8	0.078	0.23	1.71×10^{-4}	0.0085

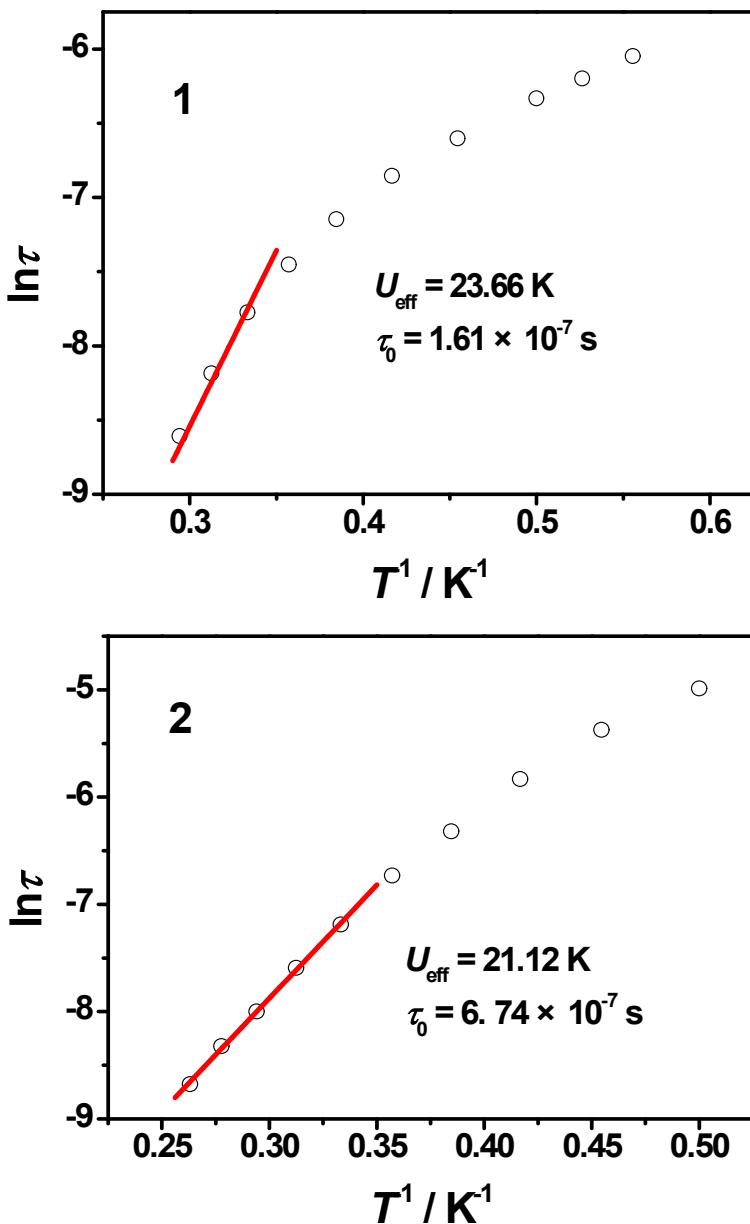

Fig. S19 Relaxation time of the magnetization $\ln(\tau)$ vs T^{-1} plots for **1** and **2**.

At low fields, Raman process is weakly field dependent and thus they have been represented by constant of $k(T)$.^{S47} In addition, both of the quantum tunneling of the magnetization and the direct processes are strongly affected by even applying a small magnetic field.^{S48,S49} Therefore, the field dependence of the relaxation at 1.8 K was analyzed by eq (1),

$$\tau^{-1} = AH^4T + \frac{B_1}{1+B_2H^2} + k(T) \quad (1)$$

where the first term represents direct process, the second term represents quantum tunneling of magnetization and the last term represents Raman processes.

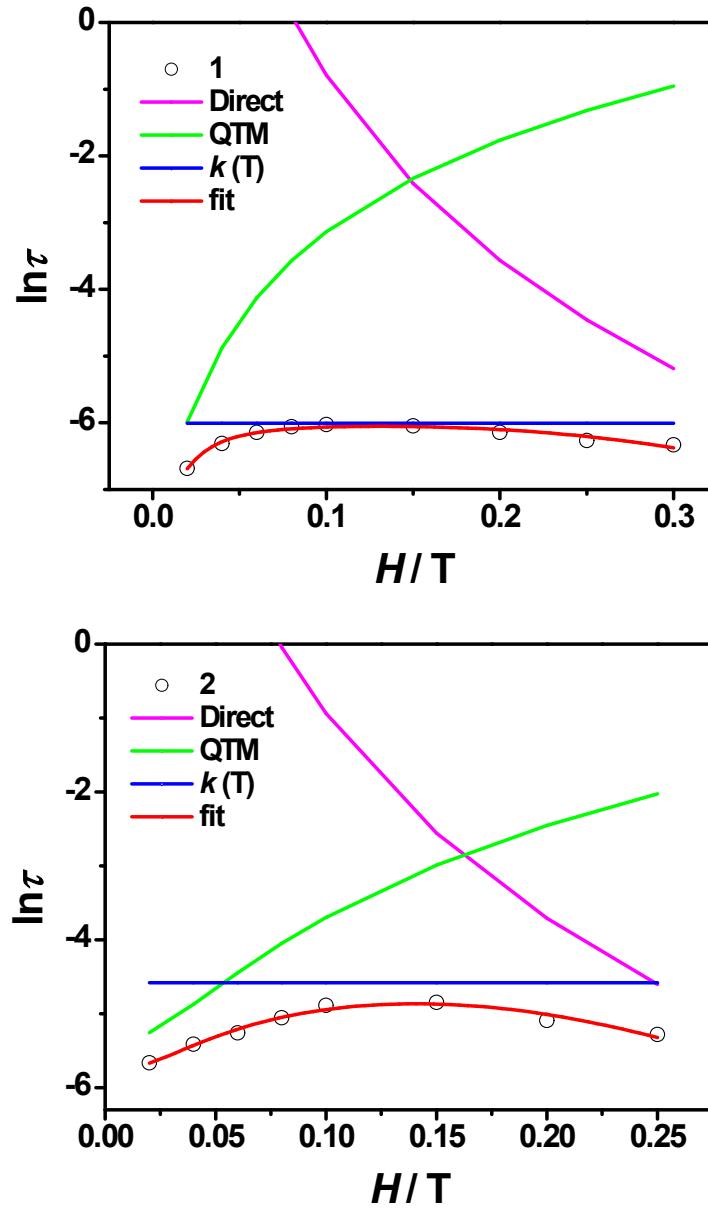

Fig. S20 Field dependence of the magnetization relaxation rates for **1** under 1.8 K and **2** under 2 K. The red line represents the best fit by using eq (1). The other lines represent the contribution of direct (purple), QTM (green) and Raman processes (blue), respectively.

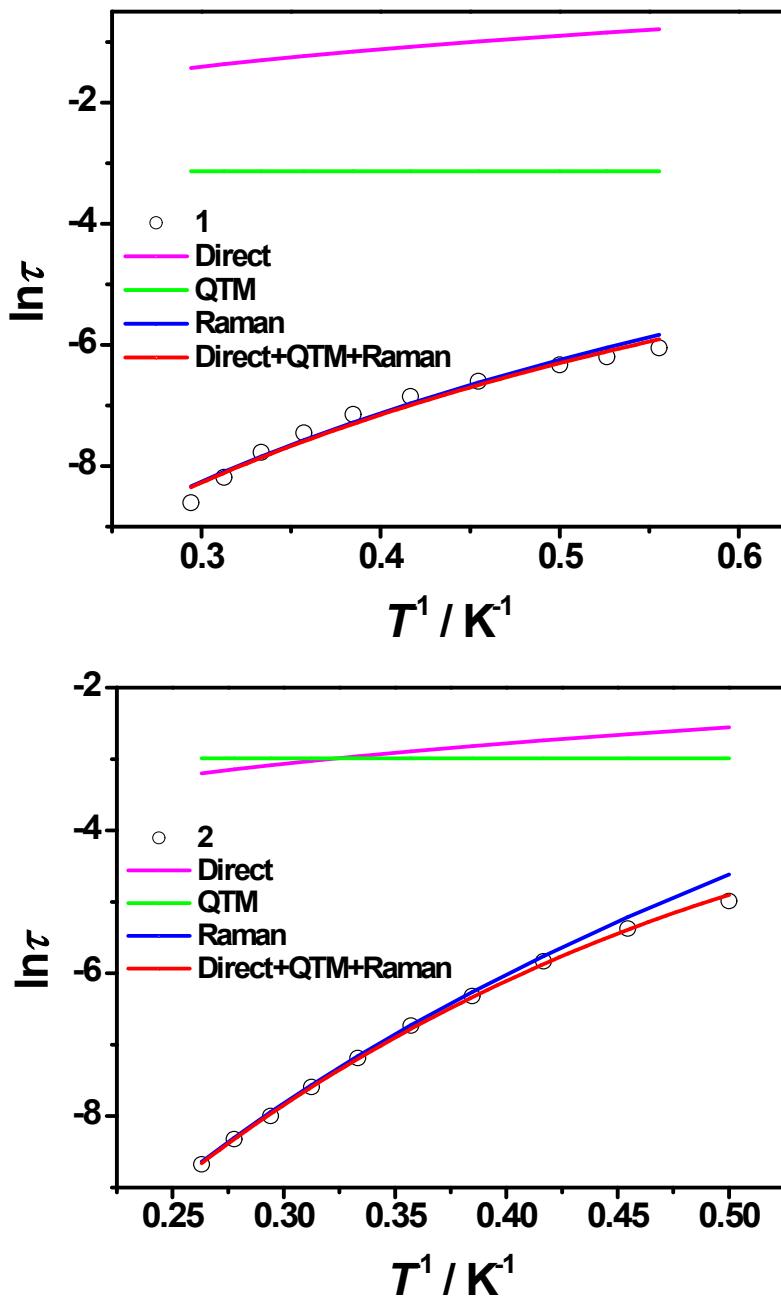

Fig. S21 Temperature dependence of the magnetization relaxation rates for **1** and **2**.

The red line represents the best fit by a model including three possible relaxation processes. The other lines represent the contribution of direct (purple), QTM (green) and Raman processes (blue), respectively.
