### Standard-state conversions<sup>1</sup>

By default, the geometry optimization in Gaussian 16 was carried out at the standard pressure and temperature (1 atm at 298.15 K). To convert to the standard state in the solution phase (1 M at 298.15 K), the equation S1 was applied to convert the free energy from the standard state at 1 atm to the standard state at 1 M. Let A, B, and C as an example of ideal gases,

Thus, 
$$\Delta G^{\circ'} = \Delta G^{\circ} + RT \ln \frac{Q^{\circ'}}{Q^{\circ}} \quad (\text{S2})$$

where R is the gas constant, T is the temperature,  $Q$  is the reaction quotient ( $Q = \frac{[B][C]}{[A]}$ ),  $Q^{\circ}$  is the reaction quotient at 1 atm,  $Q^{\circ'}$  is the reaction quotient at 1 M,  $\Delta G^{\circ}$  is the free energy at 1 atm, and  $\Delta G^{\circ'}$  is the free energy at 1 M.

The concentration of 1 atm of ideal gas is  $\frac{1}{24.46} \text{ mol/L}$  at 298.15 K.

Thus, 
$$\Delta G^{\circ'} = \Delta G^{\circ} + RT \ln \frac{\frac{1}{24.46}}{\frac{1}{24.46 \cdot 24.46}} \quad (\text{S3})$$

$$\Delta G^{\circ'} = \Delta G^{\circ} + RT \ln(24.46) \quad (\text{S4})$$
