Table S1 The weight percentages of Mn and Co in the MnCoO-CN composite by ICP-OES.

Element	wt%
Mn	50.9
Co	1.8

Estimation of capacity based on MnO₂ mass according to the results in Table S1:

According to ICP analysis, 50.9 wt% weight in the MnCoO-CN composite material is from Mn element. When all Mn transforms to MnO₂ after conditioning, the weight portion of MnO₂ with respect to the initial overall weight is $50.9 \text{ wt\%} \div M_{Mn} \times M_{MnO_2} = 50.9 \text{ wt\%} \div 54.94 \text{ g mol}^{-1} \times 86.94 \text{ g mol}^{-1} = 80.5\%$. The cathode delivers 425 mAh g⁻¹ capacity after conditioning based on the initial composite mass, which corresponds to the capacity of $425 \text{ mAh g}^{-1} \div 80.5\% = 527 \text{ mAh g}^{-1}$ based on the mass of MnO₂.

Table S2 Calculation of two-electron transfer contribution in MnO₂.

Cathode	MnO ₂	MnO ₂ /CoO _x -CN
Mn concentration in electrolyte at the charged state (mM)	36.1	57.3
Mn concentration in electrolyte at the discharged state (mM)	95.7	183.6
Two-electron transfer mass (mg) = conc[diff] (mM) × 60 (μL) × 86.94 (g mol ⁻¹)	0.311	0.659
Overall MnO ₂ mass (mg)	1.25	0.822
Two-electron transfer % = two-electron transfer mass ÷ overall MnO₂ mass × 100%	25%	80%

Discussion of Table S2:

To measure the Mn concentrations in the electrolyte at different states, the electrolyte in cycled cells is extracted from separators. The Mn/Zn ratios are measured by ICP, and the Zn concentration of 3 M is used as a reference to calculate Mn concentrations. The fluctuation of Zn concentration during charge/discharge is only a minority of the overall Zn content in the 3 M ZnSO₄ electrolyte. To be more specific, 60 μL electrolyte in the cell contains 60 μL × 3 M = 0.18 mmol of Zn. The MnO₂/CoO_x-CN cathode reaches the highest capacity around 0.433 mAh. This is the same as the Zn deposition capacity at the anode, which corresponds to 0.433 mAh ÷ 820 mAh g⁻¹ ÷ 65.4 g mol⁻¹ = 0.008 mmol of Zn. The concentration change in the electrolyte is only 0.008/0.18 = 5%, assuming no Zn participation in the cathode reaction. This change is small, and the utilization of Zn concentration as the reference to calculate Mn concentration is thus feasible.

During the two electron reaction of MnO₂, Mn²⁺ is formed during discharge, and its dissolution in the electrolyte causes Mn concentration increase. Upon charge, Mn²⁺ is oxidized and deposited back to the cathode as MnO₂, and Mn concentration in the electrolyte decreases. Therefore, the Mn concentration difference between the charged and discharged states is the active material undergoing reversible two-electron transfer of MnO₂/Mn²⁺ based on the dissolution/deposition reaction. The corresponding mass of MnO₂ is calculated based on the following equation:

$$m_{two-electron} = (c_{dis.} - c_{ch.}) \times V_{electrolyte} \times M_{MnO_2} \quad \text{equation (1)}$$

The mass contribution of two-electron transfer in the total MnO₂ is calculated based on the following equation:

$$\omega_{two-electron} = \frac{m_{two-electron}}{m_{MnO_2}} \times 100\% \quad \text{equation (2)}$$

In the above equations, $c_{dis.}$ and $c_{ch.}$ represent the Mn concentrations in electrolyte at the discharged and charged states, respectively; $V_{electrolyte}$ corresponds to the volume of electrolyte; M_{MnO_2} is the molecular weight of MnO₂; m_{MnO_2} is the MnO₂ mass.

Table S3 Capacity comparison of the MnO₂/CoO_x-CN cathode in the Mn²⁺ free electrolyte of 3 M ZnSO₄ with previously reported manganese oxide cathodes using electrolytes containing pre-added Mn²⁺ salts in aqueous zinc batteries.

Cathode material	Electrolyte	Current density/rate	Capacity	Ref.
Od-Mn ₃ O ₄	2 M ZnSO ₄ + 0.2 M MnSO ₄	0.2 A g ⁻¹	396 mAh g ⁻¹	1
MO-ZMO	2 M Zn(CF ₃ SO ₃) ₂ + 0.1 M MnSO ₄	0.1 A g ⁻¹	247 mAh g ⁻¹	2
Mg _{0.9} Mn ₃ O ₇ ·2.7H ₂ O	3 M ZnSO ₄ + 0.1 M MnSO ₄	0.2 A g ⁻¹	312 mAh g ⁻¹	3
BMO-6	2 M ZnSO ₄ + 0.25 M MnSO ₄	0.1 A g ⁻¹	363 mAh g ⁻¹	4
Cu-MnO ₂	2 M ZnSO ₄ + 0.3 M MnSO ₄	0.1 A g ⁻¹	443 mAh g ⁻¹	5
PODA/MnO ₂	2 M ZnSO ₄ + 0.1 M MnSO ₄	0.1 A g ⁻¹	321 mAh g ⁻¹	6
MnO ₂ /CoO _x -CN	3 M ZnSO ₄	0.1 A g ⁻¹ 0.2 A g ⁻¹	425 mAh g ⁻¹ 369 mAh g ⁻¹	This work

Table S4 Cycling performance comparison of the MnO₂/CoO_x-CN cathode in the Mn²⁺ free electrolyte of 3 M ZnSO₄ with previously reported manganese oxide cathodes using electrolytes containing pre-added Mn²⁺ salts in aqueous zinc batteries.

Cathode material	Electrolyte	Current density/rate	Cycling performance	Ref.
Od-Mn ₃ O ₄	2 M ZnSO ₄ + 0.2 M MnSO ₄	5.0 A g ⁻¹	95.7% after 12000 cycles	1
Mg _{0.9} Mn ₃ O ₇ ·2.7H ₂ O	3 M ZnSO ₄ + 0.1 M MnSO ₄	0.2 A g ⁻¹ 5.0 A g ⁻¹	95% after 100 cycles 92% after 5000 cycles	3
BMO-6	2 M ZnSO ₄ + 0.25 M MnSO ₄	1.0 A g ⁻¹	93% after 10000 cycles	4
PANI-MnO ₂	2 M ZnSO ₄ + 0.1 M MnSO ₄	0.2 A g ⁻¹ 2.0 A g ⁻¹	89% after 200 cycles 83% after 5000 cycles	7
α-MnO ₂	2 M ZnSO ₄ + 0.1 M MnSO ₄	5 C	92% after 5000 cycles	8
Ca _{0.28} MnO ₂	1 M ZnSO ₄ + 0.1 M MnSO ₄	3.5 A g ⁻¹	92% after 5000 cycles	9
CNT@KMO@GC	2 M ZnSO ₄ + 0.2 M MnSO ₄	10.0 A g ⁻¹	80% after 10000 cycles	10
MnO ₂	2 M ZnSO ₄ + 0.005 M MnSO ₄	10 mA cm ⁻²	100% after 16000 cycles	11
K-V ₂ C@MnO ₂	2 M ZnSO ₄ + 0.25 M MnSO ₄	0.3 A g ⁻¹ 2.0 A g ⁻¹	87% after 180 cycles 82% after 5000 cycles	12
MnO ₂ /CoO _x -CN	3 M ZnSO ₄	0.2 A g ⁻¹ 2.0 A g ⁻¹	81.6% after 300 cycles 83.1% after 25000 cycles	This work
