**Figure S1:** HPLC chromatogram of anthocyanins (A) and other polyphenols (B) in DMW using 520 nm and 260 nm detection, respectively. Peaks 1, 2, 3, 4, 5 and 6 in panel A are delphinidin-3,5-diglucoside, cyanidin-3,5-diglucoside, petunidin-3,5-diglucoside, pelargonidin-3,5-diglucoside, peonidin-3,5-diglucoside and malvidin-3,5-diglucoside, respectively. Peaks 7, 8, 9, 10, and 11 in panel B are gallic acid, ellagic acid, myricetin, quercetin, and kaempferol, respectively.

**Figure S2.** Food intake (A) and Change of food intake % (B) in different groups. Data were mean  $\pm$  standard deviation for 4 cages per group. +,  $p < 0.05$  in Healthy vs Colitis; #,  $p < 0.05$  in Prevention vs Colitis; \*,  $p < 0.05$  in P+T vs Colitis; ^,  $p < 0.05$  in Treatment vs Colitis.

**Figure S3.** Relative mRNA level of ZO-1 (A) and occludin (B) in mice colon, normalized by GAPDH, and relative protein expression levels of ZO-1 (C) and occludin (D) normalized by  $\beta$ -actin, assessed by Western blot and quantified via Image J software. (E) Western blot images of  $\beta$ -actin (internal control), ZO-1 and occludin protein expression in the colon. Data are mean  $\pm$  SD ( $n=8$ ) and analyzed by Student's t-test. Different lowercase letters indicate significant differences among groups.
