

Figure S1. Body weight gain throughout the experiment. (a): Body weight gain in females rats-fed with either STD or CAF and treated with VH or GSPE at ZT0 or ZT12 for the last 4 weeks. (b): Body weight gain in males rats-fed with either STD or CAF and treated with VH or GSPE at ZT0 or ZT12 for the last four weeks. # indicates significant diet effect, analyzed by repeated-measures ANOVA followed by LSD post hoc test ($p<0.05$); (c): Area under the curve (AUC) of body weight gain. Table below the graph indicates effects and interactions among the different factors (D: diet; GSPE; ZT; S: sex) analyzed by 2-way or 4-way ANOVA followed by LSD post hoc test: # and \$ indicate significant diet and sex effect respectively ($p<0.05$). Data are showed as mean \pm SD ($n = 8$). STD: standard diet; CAF: cafeteria diet; GSPE: grape seed proanthocyanidin extract; ZT: time of the day; ZT0: VH or GSPE time administration (when light was turned on); ZT12: VH or GSPE time administration (when light was turned off); n.s.: no significant differences ($p>0.05$).

Table S1. Overall effects in serum metabolites.

	Female								Male								4-way ANOVA effects ^b
