

**Joint Association of Serum Urate and Healthy Diet with Chronic Obstructive Pulmonary Disease Incidence: Results from the UK Biobank Study**

## **Method**

### **Assessment of genetic risk score**

Genetic background is thought to account for approximately 40% of the variation in susceptibility to COPD [1, 2]. Therefore, in our sensitivity analysis, we categorized the genetic risk into three groups. Detailed information on the genetic data of the UK Biobank study is available elsewhere [3]. Briefly, the custom Affymetrix UK Biobank Axiom array was used to genotype samples of study participants from the UK Biobank. Genotype data were phased using SHAPEIT3, and IMPUTE3 was used to impute to a merged reference panel of the UK10K and 1000 Genomes phase 3 [4]. To evaluate the genetic predisposition for COPD, a genetic risk score (GRS) for COPD was created. After LD clumping ( $r^2 < 0.2$ , 1000 kb), we selected 279 independent single nucleotide polymorphisms (SNPs) from a previously published genome-wide association analysis [5] (Table S2). A weighted-GRS was calculated based on the amount of risk alleles of each SNP, coding as 0, 1, or 2, then multiplied by the relative effect size ( $\beta$  coefficient) obtained from the previously published genome-wide association analysis [5], summed, and then  $z$ -standardized to create a COPD-GRS for all individuals. The COPD-GRS was oriented, so that a higher COPD-GRS was associated with lower lung function. GRS was categorized into high (tertile 3), middle (tertile 2), and low (tertile 1). The distribution of COPD-GRS was normal and is presented in Fig. S2.

### **Assessment of Mediterranean diet score (MDS)**

The MDS is a composite scoring system that incorporates both food-based and nutrient-based elements to evaluate adherence to a Mediterranean-style diet. In this investigation, a nine-item index, previously described and adapted, was employed [6, 7]. Food and nutrient consumption were assessed based on nine specific components, including vegetables, legumes, fruits and nuts, cereals, fish and seafood, the ratio of monounsaturated fats to saturated fats, dairy products, meat and meat products, and alcohol. Cut-off points for the score of each component were determined using sex-specific median intakes. Participants surpassing the median intake for vegetables, legumes, fruits and nuts, cereals, fish and seafood, and the monounsaturated to saturated fats ratio received a score of 1. Conversely, participants falling below the median intake for dairy products and meat and meat products were also assigned a score of 1. For alcohol, a score of 1 denoted low to moderate intake, equivalent to consuming alcohol once or twice daily. A score of 0 was assigned for either no

alcohol intake or an intake exceeding twice daily. The overall MDS score ranged from 0 to 9, with higher scores indicative of greater adherence to the Mediterranean diet.

<sup>1</sup> Analysis by Cox proportional hazards regression models.

<sup>2</sup> Crude model.

<sup>3</sup> Hazard ratios (95% confidence interval) (all such values).

<sup>4</sup> Adjusted for age, sex, and BMI.

<sup>5</sup> Additionally adjusted for height, household income, education levels, physical activity, Townsend deprivation index, physical activity, baseline metabolic syndrome, family history of diseases (hypertension, cardiovascular disease, and diabetes), and baseline FEV1/FVC ratio.

<sup>6</sup> Additionally adjusted for smoking status, drinking status, diet score, baseline asthma, SII, ethnicity, creatinine, seafood and animal organs intake, alcoholic beverages, medication history (including antihypertensive drugs, lipid-lowering drugs, hypoglycemic drugs, allopurinol, and diuretics), and personal history of diseases (hypertension, diabetes, and kidney disease).

**Table S5. Hazards ratios (HRs) and 95% confidence interval (CIs) of COPD by joint effect of SU levels and diet score after excluding COPD occurred within first 3 years of follow up (n = 154,990).**

Abbreviations: SU, serum urate; COPD, chronic obstructive pulmonary disease.

<sup>1</sup> Crude model.

<sup>2</sup> Adjusted for age, sex, and BMI.

<sup>3</sup> Additionally adjusted for height, household income, education levels, physical activity, Townsend deprivation index, baseline metabolic syndrome, family history of diseases (hypertension, cardiovascular disease, and diabetes), and baseline FEV1/FVC ratio.

<sup>4</sup> Additionally adjusted for smoking status, alcohol consumption, baseline asthma, SII, ethnicity, creatinine, seafood and animal organs intake, alcoholic beverages, medication history (including antihypertensive drugs, lipid-lowering drugs, hypoglycemic drugs, allopurinol, and diuretics), and personal history of diseases (hypertension, diabetes, and kidney disease).

<sup>5</sup> Hazard ratios (95% confidence interval) (all such values).

**Table S8. Hazards ratios (HRs) and 95% confidence interval (CIs) of COPD by joint exposures of SU levels and diet score: results from competing risk regression model (n = 155,403).**

| Joint effect       |            | Number of participants | Number of incident COPD | Model 1 <sup>1</sup>                  | Model 2 <sup>2</sup>     | Model 3 <sup>3</sup>     | Model 4 <sup>4</sup>     |

<sup>1</sup> Crude model.

<sup>2</sup> Adjusted for age, sex, and BMI.

<sup>3</sup> Additionally adjusted for height, household income, education levels, physical activity, Townsend deprivation index, baseline metabolic syndrome, family history of diseases (hypertension, cardiovascular disease, and diabetes), and baseline FEV1/FVC ratio.

<sup>4</sup> Additionally adjusted for smoking status, alcohol consumption, baseline asthma, SII, ethnicity, creatinine, seafood and animal organs intake, alcoholic beverages, and medication history (including antihypertensive drugs, lipid-lowering drugs, hypoglycemic drugs, allopurinol, and diuretics).

<sup>5</sup> Hazard ratios (95% confidence interval) (all such values).

**Table S14. Associations between Mediterranean diet score (MDS) and risk of COPD (n = 155,403).**

|                | Number of participants | Number of incident COPD | Model 1 <sup>1</sup>                  | Model 2 <sup>2</sup>     | Model 3 <sup>3</sup>     | Model 4 <sup>4</sup>     |
