## Supplementary methods

### Method for determination of pectin content

To determine the soluble pectin content, freeze dried samples were firstly refluxed with 80% (v/v) ethanol at 80 °C for 1 h to remove low molecular weight sugars. Then, the alcohol-insoluble residue was dissolved in hot water (90°C) for another 2 h. After centrifugation (4000 × g for 15 min), the extracts were concentrated and then precipitated with three volumes of 95% (v/v) ethanol overnight at 4°C. The precipitates were washed twice with 70% of ethanol and dissolved in deionised water. Finally, the water-soluble pectin fractions were freeze dried and used for determination of pectin content by *m*-hydroxydiphenyl method with galacturonic acid (GalA) as a standard according to a previous method with minor modifications<sup>1</sup>. In brief, 9 mg of freeze-dried pectin fraction from pulp or 6 mg of the pectin fraction from pulp + BC were dissolved in 10 mL deionised water, respectively. Then 100 µL samples were mixed with 1 mL of 12.5 mM sodium tetraborate in H<sub>2</sub>SO<sub>4</sub>, and then stirred vigorously and heated to 95°C for 10 min. After cooling to room temperature, 20 µL of 0.15% (w/v) *m*-hydroxydiphenyl in 0.5% (w/v) NaOH was added and stirred by vortex mixing. The samples were then kept at room temperature for 10 min and absorbances were read at 525 nm.

### Results

	Pulp	Pulp + BC	Placebo
Pectin (GalA content, mg GalA/g)	25.8 ± 1.0	51.1 ± 0.5	—

Values represent means ± standard errors. GalA, galacturonic acid. BC, Blackcurrant.
