

A)

B)

**Supplemental Figure 1.** A and B) Hardness of emptied gastric digesta from the HGS every 30 min up to 150 min (digestion time) of expanded products enriched with and without catechin at different moisture levels (27 or 31%) and processed using different extrusion temperatures (110, 135, or 150°C). Results are expressed as mean ( $n=3$ )  $\pm$  95% confidence interval.

**Supplemental Figure 2** Examples of binary images of extruded 3G snacks (previous sieved) and gastric digesta used for extraction of particle size parameters for the expanded product at 27% moisture content and 150°C before digestion and after 30 up to 180 min gastric digestion. The scale bar represents 1 cm and is the same for all images.

**Supplemental Table 1** Particle size parameters (x50 and b derived from the Rosin-Rammler equation <sup>41</sup>) after gastric digestion (30 min up to 180 min) of the expanded products enriched with (EPC) and without catechin (EP) at different moisture levels (27 or 31%) and processed using different extrusion temperatures (110, 135, or 150°C). Values shown are mean (n=3) ± 95% confidence interval.

T M	110°C			135°C			150°C

\*DG= digestion time

**Supplemental Table 2** Digestion time used for analysis of the total starch hydrolysis analysis was the combination of gastric digestion plus small intestinal digestion. 0 min intestinal time (first row) represents samples taken directly after the gastric phase with no intestinal digestion. Values from all samples with the same total gastrointestinal time was summed to determine the total starch hydrolysis at each time.

		Gastrointestinal time (min)					
Gastric Time →		30 min G+I	60 min G+I	90 min G+I	120 min G+I	150 min G+I	180 min G+I
Intestinal Time ↓		30	60	90	120	150	180
0 min		30	60	90	120	150	180
30 min		60	90	120	150	180	210
60 min		90	120	150	180	210	240
90 min		120	150	180	210	240	270
120 min		150	180	210	240	270	300
150 min		180	210	240	270	300	330
180 min		210	240	270	300	330	360
