**Supplementary Figure 3. Effects of *B. uniformis* 1K1 on the concentrations of short-chain fatty acids (SCFAs)**

**Supplementary Figure 4. The interaction between *Bacteroides* strains and other microbes**

Note: NTBF, non-toxigenic *B. fragilis*; ETBF, enterotoxigenic *B. fragilis*.

*Bacteroides* can affect other *Bacteroides* as well as microorganisms through a variety of complex pathways. Typically, *B. vulgatus* can inhibit the *Y. enterocolitica*-induced NF- $\kappa$ B activation and IL-8 production (Frick et al. doi:10.1128/IAI.00119-07). *B. uniformis* can secrete membrane attack complex/perforin toxins (BSAP-2) for intraspecies killing, especially the *B. uniformis* BSAP-2 sensitive strain (García-Bayona and Laurie. doi:10.1126/science.aat2456). Besides, type VI secretion systems (T6SSs) are a type of system that can realize the interspecific killing of *B. fragilis*. TS66 is a multiprotein complex that has been shown to inhibit or kill prokaryotic or eukaryotic cells. The toxic effector enters the target cell directly through the contractile bacteriophage tail T6SS to exert its inhibitory effect (García-Bayona and Laurie. doi:10.1126/science.aat2456). Therefore, the genus of *Bacteroides* is a complex and changeable system, which is easily affected by multiple external and internal factors.
