General Remarks

Chromatographic purification of products was accomplished using forced-flow chromatography on Merck® Kieselgel 60 70-230 mesh. Thin-layer chromatography (TLC) was performed on aluminum backed silica plates (0.2 mm, 60 F_{254}). Visualization of the developed chromatogram was performed by fluorescence quenching using phosphomolybdic acid, anisaldehyde or potassium permanganate stains. Melting points were determined on a Buchi® 530 hot stage apparatus and are uncorrected. Mass spectra (ESI) were recorded on a Finningan® Surveyor MSQ LCMS spectrometer. HRMS spectra were recorded on a Bruker® Maxis Impact QTOF spectrometer. $^1$H-NMR, $^{19}$F-NMR and $^{13}$C-NMR spectra were recorded on a Varian® Mercury (200 MHz, 188 MHz and 50 MHz, respectively) or on an Avance III HD Bruker 400 MHz (400 MHz, 376 MHz and 100 MHz, respectively) or on a Bruker Avance Neo 600 MHz (600 MHz and 150 MHz) and are internally referenced to residual solvent signals. Data for $^1$H-NMR are reported as follows: chemical shift (δ ppm), integration, multiplicity (s = singlet, d = doublet, t = triplet, q = quartet, m = multiplet, br s = broad signal), coupling constant and assignment. Data for $^{19}$F-NMR are reported in terms of chemical shift (δ ppm) and are internally referenced to trifluoroacetic acid (188 MHz) or fluoroform (376 MHz). Data for $^{13}$C-NMR are reported in terms of chemical shift (δ ppm). Mass spectra and conversions of the reactions were recorded on a Shimadzu® GCMS-QP2010 Plus Gas Chromatograph Mass Spectrometer utilizing a MEGA® column (MEGA-5, F.T.: 0.25 μm, I.D.: 0.25 mm, L: 30 m, T_{max}: 350 °C, Column ID#: 11475). Catalyst 3a-3e were synthesized following literature procedures.¹

NMR Mechanistic Studies

First, we investigated the halogen-bond (XB) between iodonium catalyst 3e with 3-phenyl-propanal (1a) by $^1$H- and $^{13}$C-NMR (600 MHz and 150 MHz, CD$_2$Cl$_2$). We observed a slight low-field proton and a significant carbon shift, which indicates the halogen bond between 3e and 1a.

$^{13}$C-NMR spectrum (150 MHz) of 3-phenyl-propanal (1a) and 3-phenylpropanal (1a) with catalyst 3e in CD$_2$Cl$_2$. 
Also, we investigated the halogen-bond (XB) between iodonium catalysts 3b or 3a with 3-phenyl-propanal (1a) by $^1$H- and $^{13}$C-NMR (600 MHz and 150 MHz, CD$_2$Cl$_2$). We observed similar low-field proton and carbon shifts, which indicates the halogen bond between 3a and 1a, but between 3b and 1a, we did not observe any significant change.

Next, we investigated the halogen-bond (XB) between iodonium catalyst 3e with indole (2a) by $^1\text{H}$- and $^{13}\text{C}$-NMR (400 MHz and 100 MHz, DMSO-$d_6$). We did not observe any significant change.

Procedure for Gram Scale Reaction

In a round bottom flask, containing catalyst 3e (2 mg, 1 μmol), in H₂O (25 mL), 3-phenyl-propanal (1.34 g, 10.00 mmol) and indole (2.58 g, 22.00 mmol) were added consecutively. The reaction mixture was stirred for 18 h. After reaction completion, the reaction mixture was extracted in EtOAc (50 mL). The organic layer was concentrated in vacuo. The desired product was isolated after purification by column chromatography, 2.74 g, 79% yield.

Procedure for Green Metrics Reaction

In a glass vial, containing catalyst 3e (0.4 mg, 0.2 μmol) in H₂O (0.5 mL), 3-phenyl-propanal (27 mg, 0.20 mmol) and indole (52 mg, 0.44 mmol) were added consecutively. The reaction mixture was stirred for 18 h. After reaction completion, the reaction mixture was extracted with EtOAc (2 mL). The organic layer was concentrated in vacuo. No further purification was required.

E-factor calculation

After obtaining the desired product, without proceeding in purification by column chromatography, the E-factor was calculated.

\[
E \text{ factor} = \frac{[1804 \text{ (EtOAc)} + 500 \text{ (H₂O)} + 27 \text{ (3-phenyl-propanal)} + 52 \text{ (indole)} + 0.4 \text{ (catalyst 3e)} - 68 \text{ (product)}]}{68 \text{ mg}} = 34.1
\]
$^1$H NMR spectrum (400MHz, CDCl$_3$) of crude reaction mixture after extraction

$^1$H NMR spectrum (400 MHz, CDCl$_3$) of isolated product after purification by column chromatography
Atom economy calculation

\[
\% \text{ Atom econ.} = \frac{\text{Molar mass of Product}}{\text{Molar mass of All reactants}} \times 100\% = \frac{350 \text{ mg/mmol}}{(135 + 117 + 117) \text{ mg/mmol}} \times 100\% = 95\%
\]

Atom efficiency

For the formation of one molecule of product, only one molecule of water is lost.

Carbon efficiency

No carbon atom lost.

Reaction mass efficiency

\[
\frac{\text{Atom mass of desired product}}{\text{Mass of reactants}} \times 100\% = \frac{68 \text{ mg}}{27 \text{ mg} + 52 \text{ mg}} \times 100\% = 86\%
\]
