The supplementary materials include three figures and one table

FIGURE CAPTIONS

Figure S1. Elution curve of the Cu, Fe and Zn separation procedure for first column using AG MP1 resin.

Figure S2. Doping experiments to test matrix elements interferences on $\delta^{56}\text{Fe}$ (a, b, c, d, e) and $\delta^{66}\text{Zn}$ (f, g, h, i, j, k) analysis. The Fe and Zn concentration for samples and bracketing standards (IRMM 014 for Fe and SRM 683 for Zn) is the same. The errors (2SD) were calculated based on two times replicate measurement.

Figure S3. $\delta^{56}\text{Fe}$, $\delta^{65}\text{Cu}$ and $\delta^{66}\text{Zn}$ values of the in-house standards during the past 12 months, where GSB and USTC-Fe are the internal standards for Fe isotope analysis, NIST 976 and AAS are the internal standards for Cu isotope analysis,

and AAS and IRMM 3702 are the internal standards for Zn isotope analysis. The long-term precision of each reference solution is better than 0.04‰ (2SD) over this period.

Figure S1

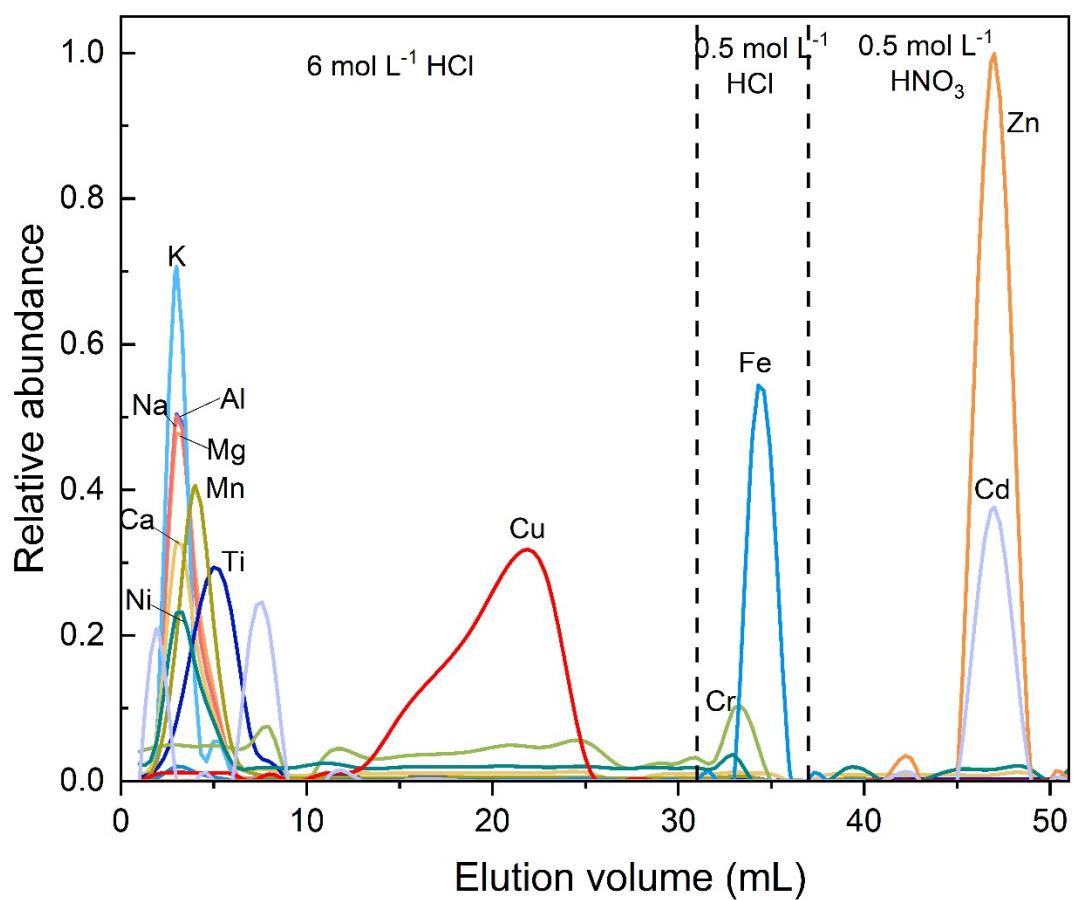

Figure S2

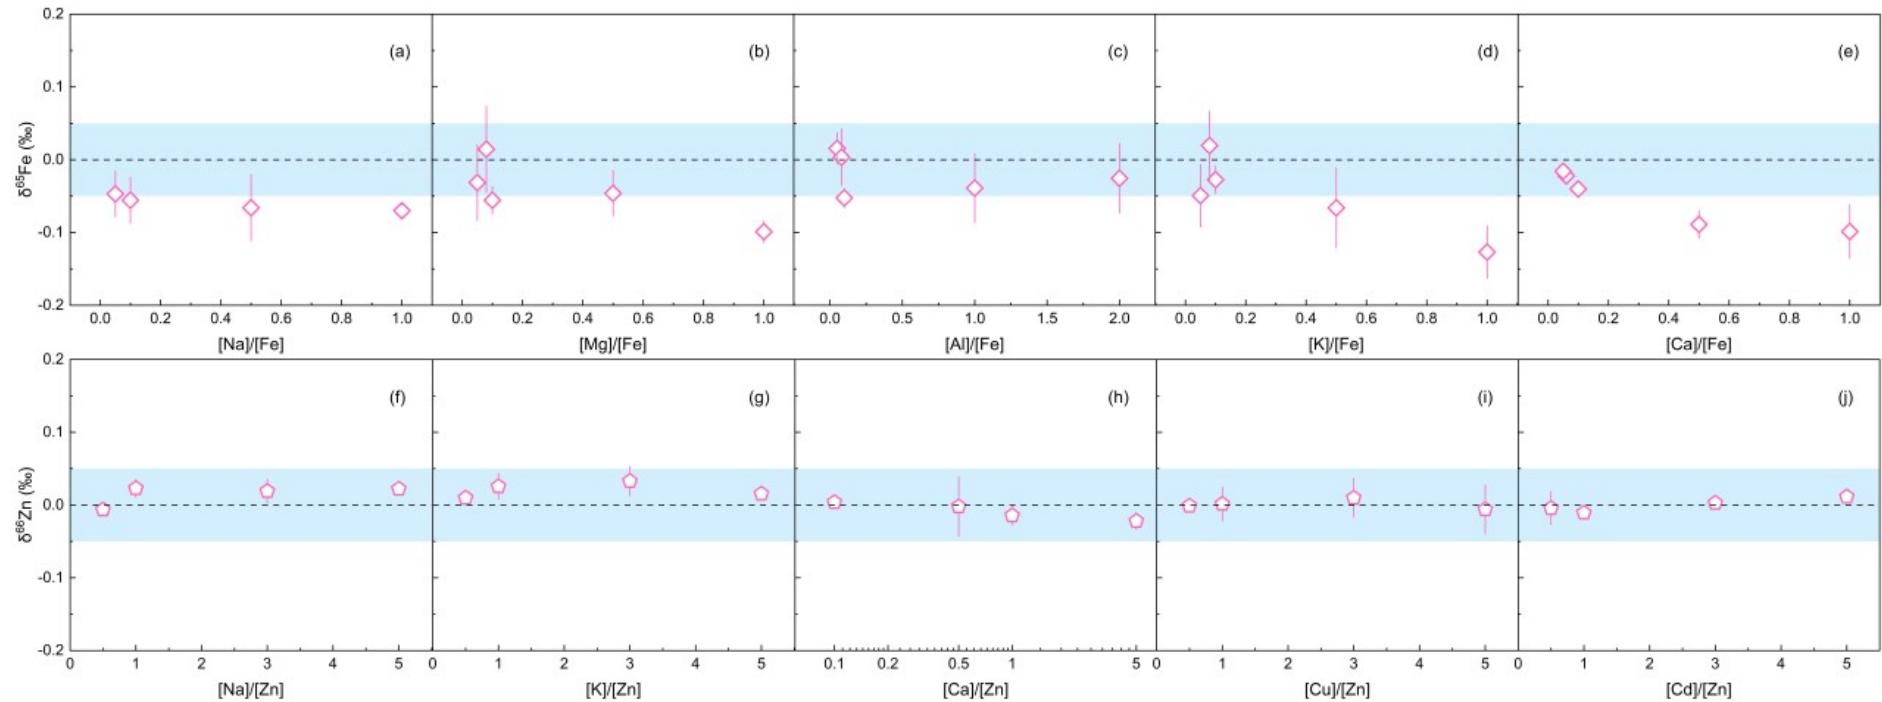

Figure S3

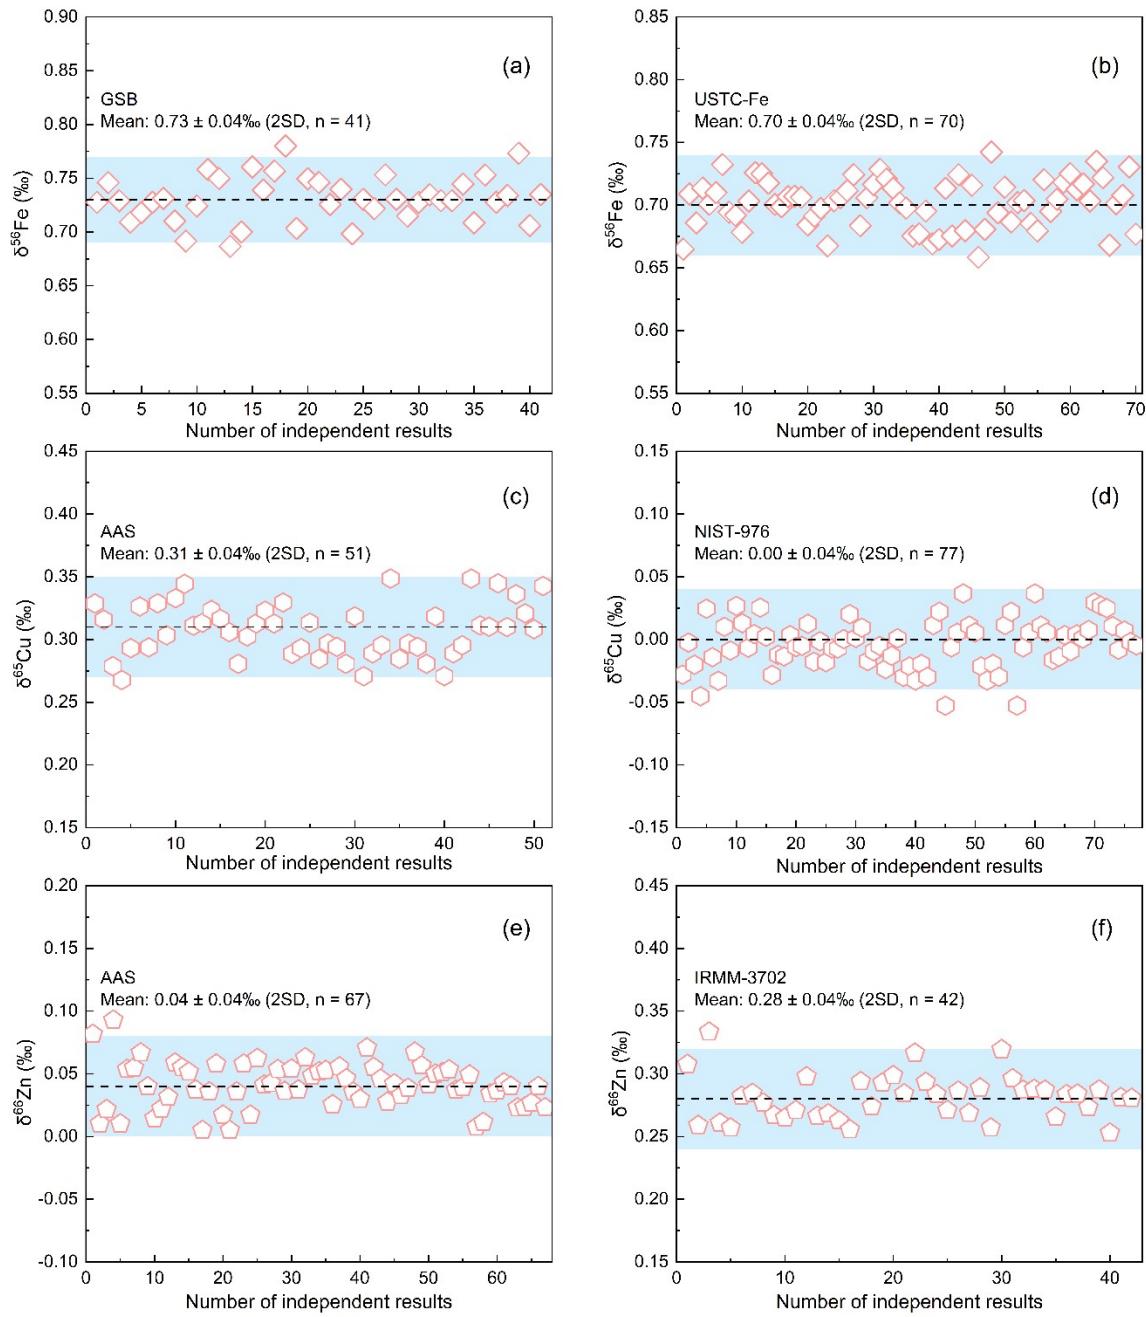

Table S1. Fe, Cu and Zn isotope compositions of biological reference materials from previous studies.
