Table of Contents

Figure S1: SEM images for samples V (vegetable oil) and VT80 (vegetable oil and Tween® 80) indicating A- V microbeads, B- VT80 debris and C- Aeroxide P25 TiO ₂ clusters.	2
Figure S2: FTIR data for samples V and VT80, showing key Ti-O-Si peak at ~950 cm ⁻¹	3
Figure S3: Raman results for samples V and VT80, as well as reference P25 indicating typical titanosilicate and TiO ₂ peaks.	3
Figure S4: Results of N ₂ -based porosity experiments for V and VT80 showing A- Adsorption-desorption isotherms and B- BJH plots.	4

Figure S5: A-Kubelka-Munk results and B- Associated τ plots for samples V, VT80, US Nano TiO₂, Aeroxide P25 TiO₂ and Silica.....4

Figure S6: Chemical structure of Rhodamine B, the selected model pollutant.4

Figure S7: Adsorption-photocatalysis results for VT80 showing A- Concentration vs. time and B – The associated C/C₀ graphs.5

Figure S8: Full UV-Vis spectrum of Rhodamine B under photocatalysis using sample S (sunflower oil) as catalyst. This demonstrates the degradation of Rhodamine B over time.....5

Figure S9: Photocatalysis results for Aeroxide P25 TiO₂, showing A- Concentration against time and B- The associated C/C₀ graph. Note that the solution concentration was 5 mg/L.6

Figure S10: Natural log of concentration vs. Time for the KS80 experiment, used to calculate the rate of reaction. A straight line here suggests pseudo first order kinetics.....6

Figure S11: Natural logs vs. time for -30- 60 mins for A- Sample S and B- Sample ST80. These were used to calculate rates of reaction between specific times.....7

Figure S12: The proposed photocatalytic mechanism for the generation of OH[•] and O₂^{-•} radicals.7

Table S1: Complete viscometry data for all templating solutions (after mixing at 1000 rpm at 80 °C).8

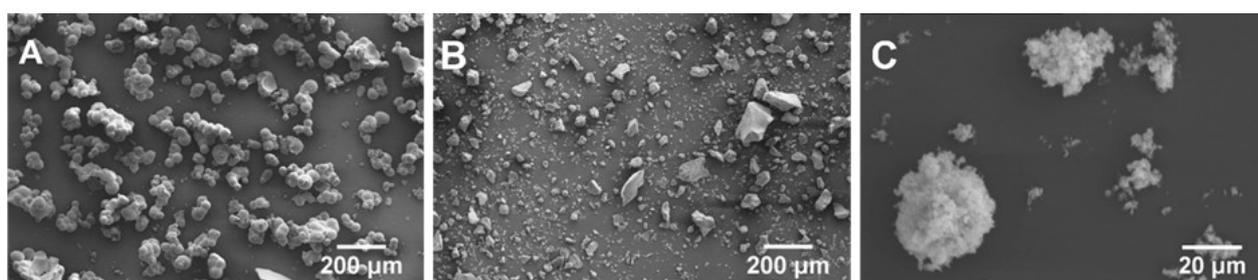

Figure S1: SEM images for samples V (vegetable oil) and VT80 (vegetable oil and Tween® 80) indicating A- V microbeads, B- VT80 debris and C- Aeroxide P25 TiO₂ clusters.

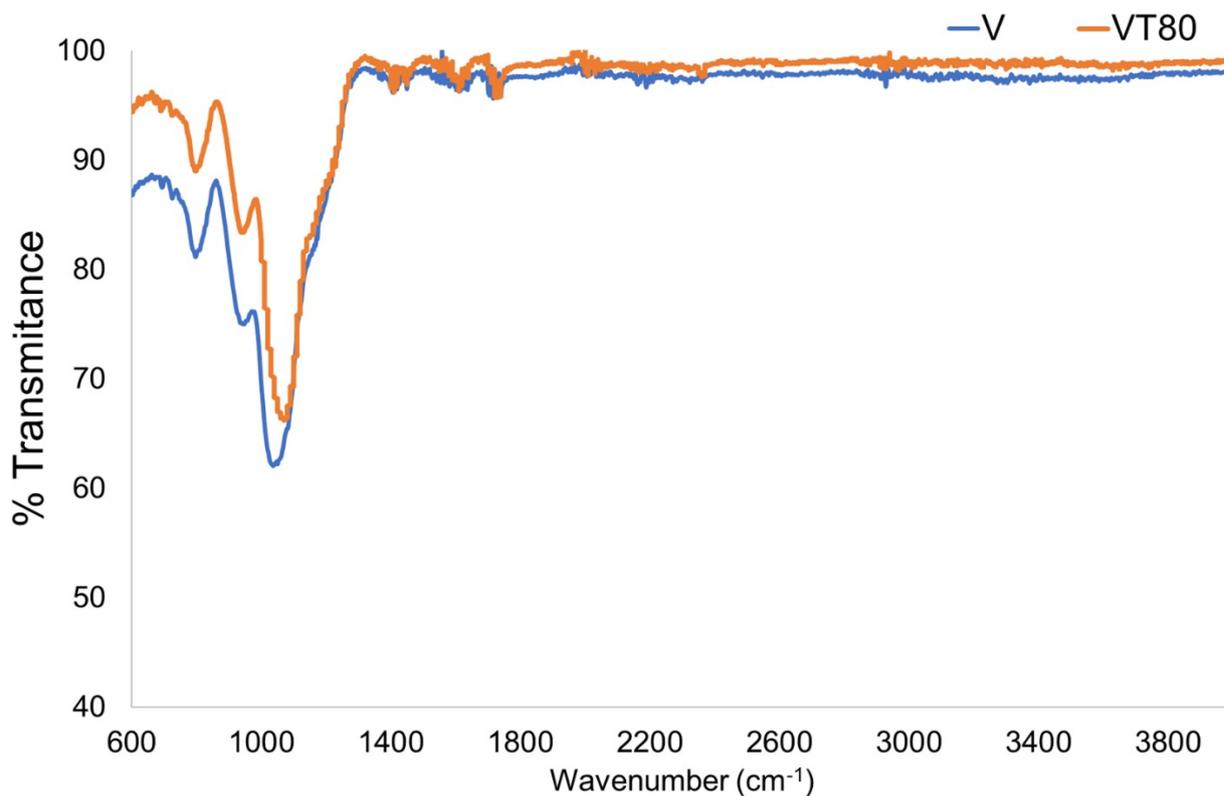

Figure S2: FTIR data for samples V and VT80, showing key Ti-O-Si peak at $\sim 950\text{ cm}^{-1}$.

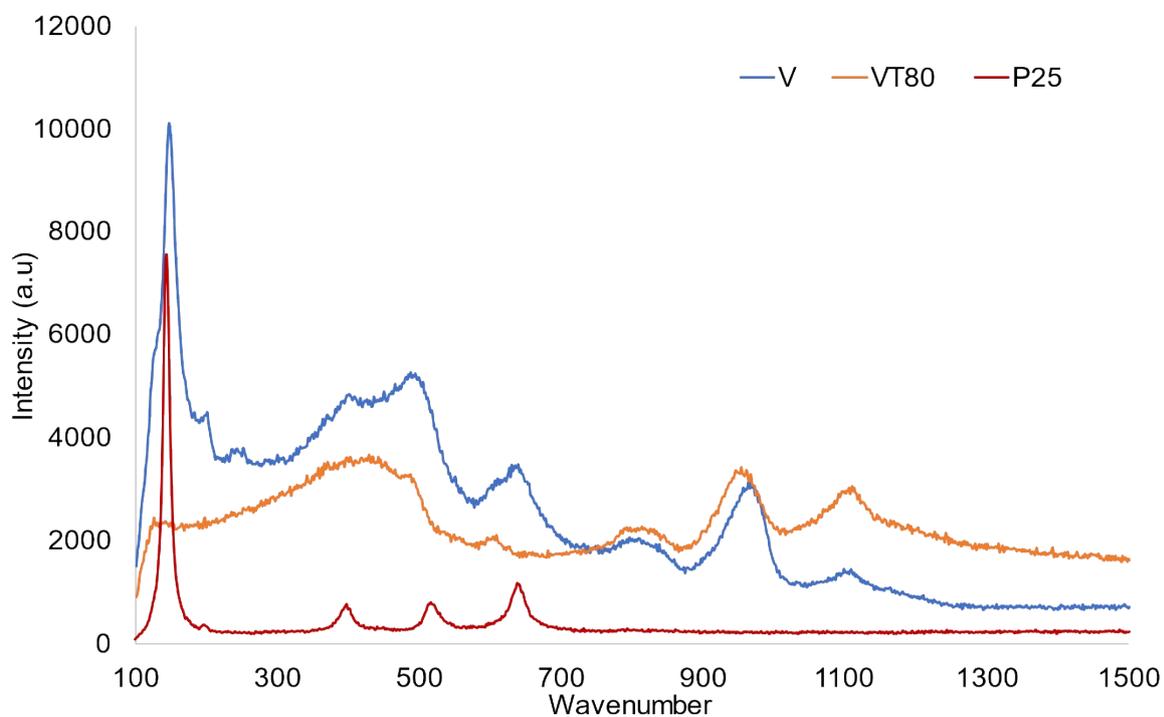

Figure S3: Raman results for samples V and VT80, as well as reference P25 indicating typical titanosilicate and TiO_2 peaks.

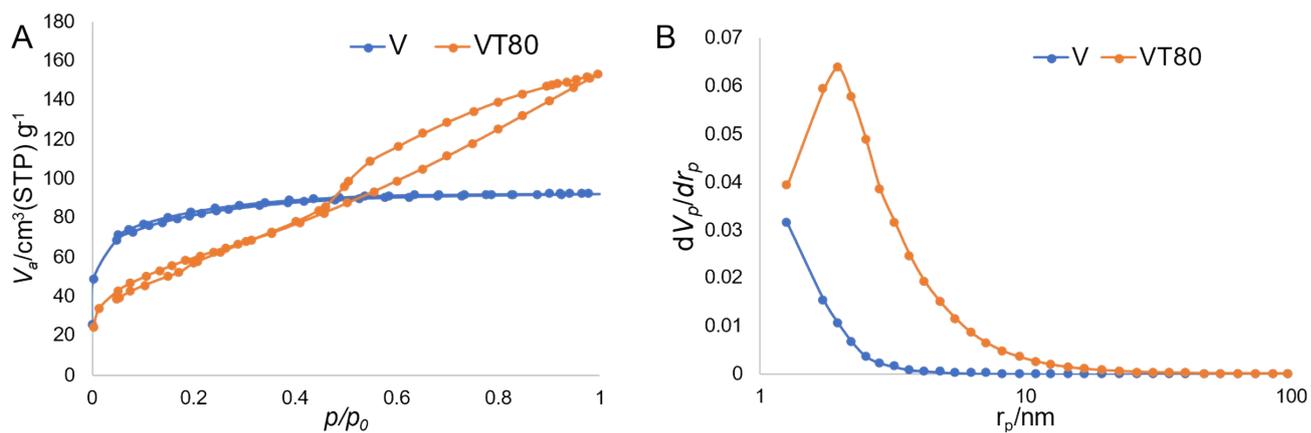

Figure S4: Results of N_2 -based porosity experiments for V and VT80 showing A- Adsorption-desorption isotherms and B- BJH plots.

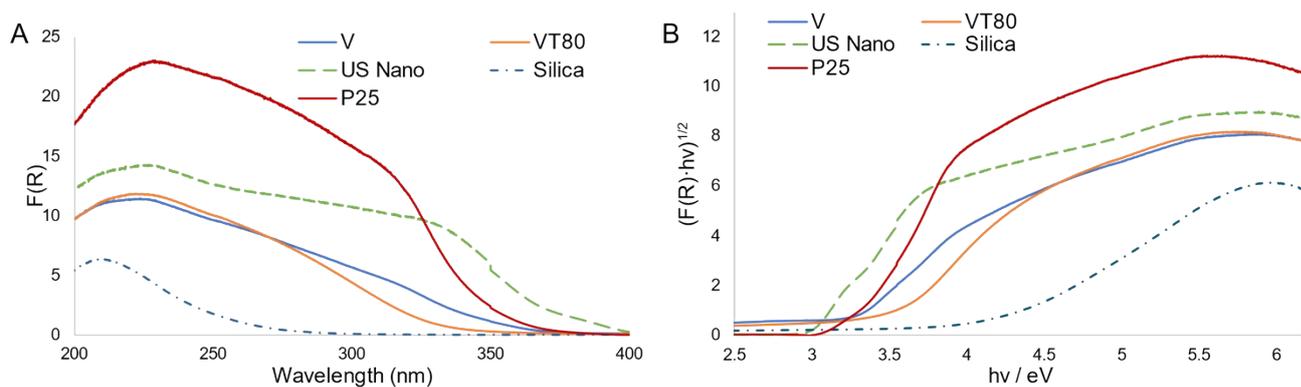

Figure S5: A-Kubelka-Munk results and B- Associated tauc plots for samples V, VT80, US Nano TiO_2 , Aeroxide P25 TiO_2 and Silica.

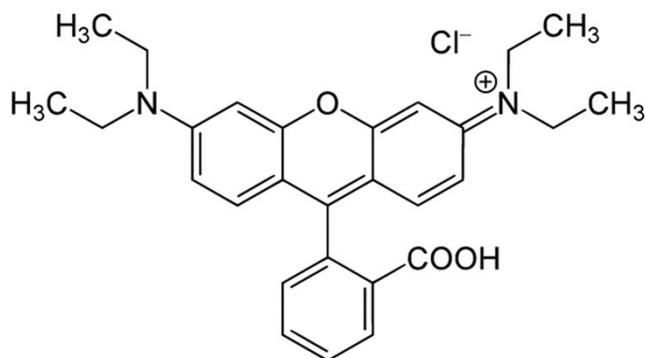

Figure S6: Chemical structure of Rhodamine B, the selected model pollutant.

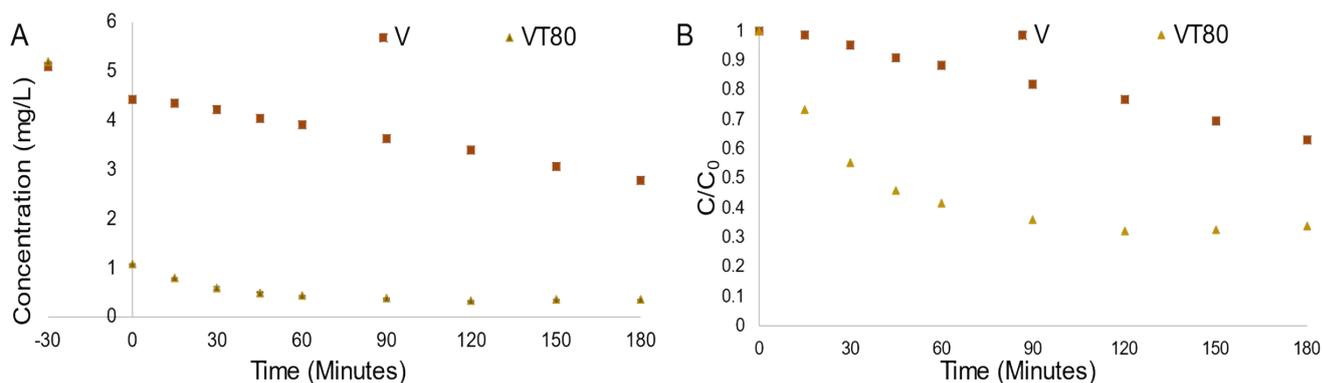

Figure S7: Adsorption-photocatalysis results for VT80 showing A- Concentration vs. time and B – The associated C/C_0 graphs.

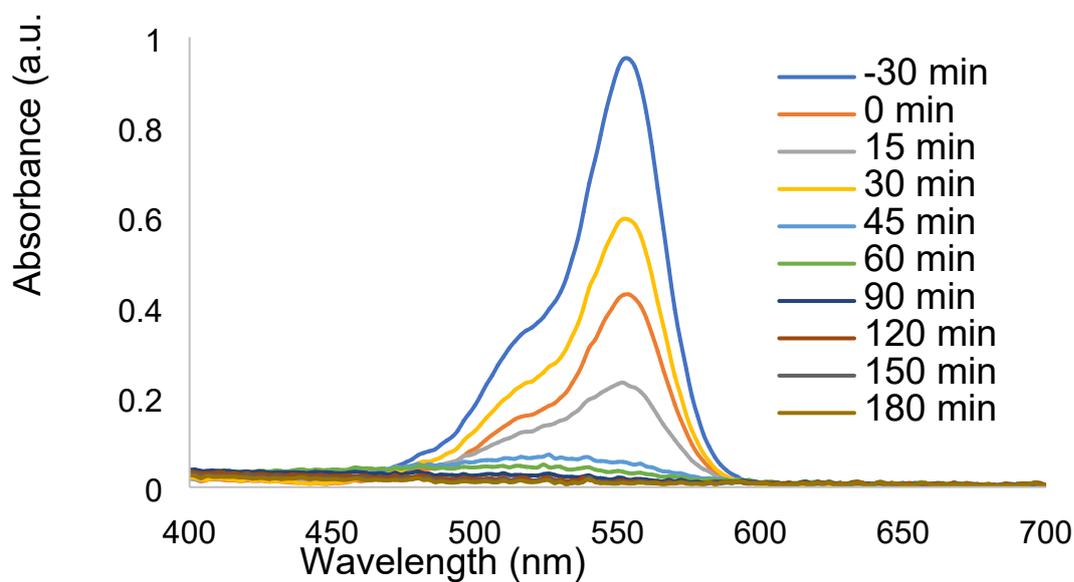

Figure S8: Full UV-Vis spectrum of Rhodamine B under photocatalysis using sample S (sunflower oil) as catalyst. This demonstrates the degradation of Rhodamine B over time.

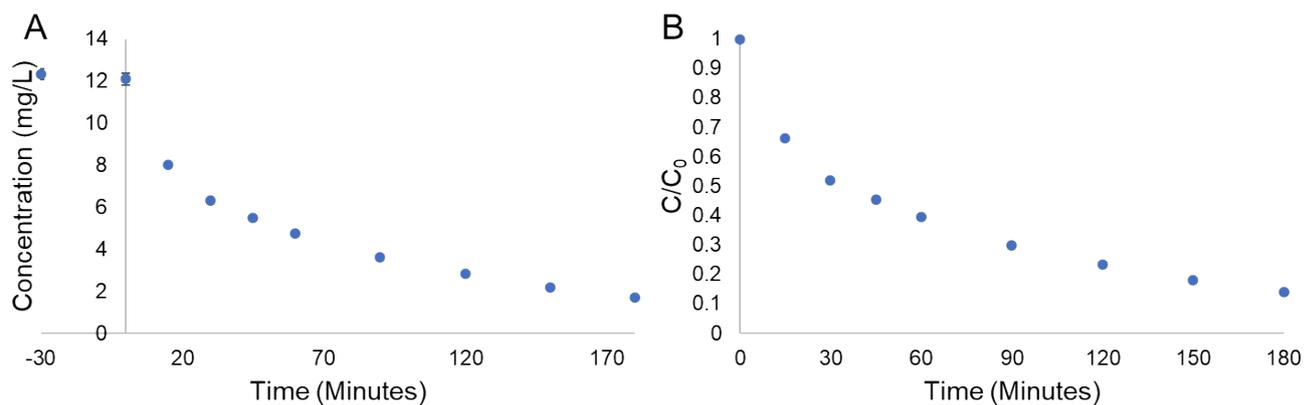

Figure S9: Photocatalysis results for Aeroxide P25 TiO₂, showing A- Concentration against time and B- The associated C/C₀ graph. Note that the solution concentration was 5 mg/L.

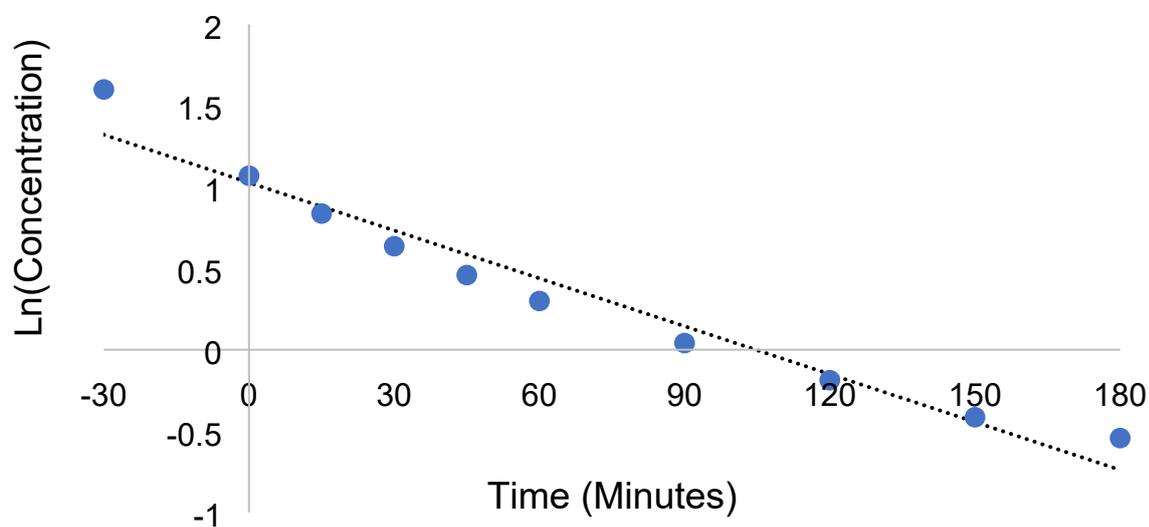

Figure S10: Natural log of concentration vs. time for the KS80 experiment, used to calculate the rate of reaction. A straight line here suggests pseudo first order kinetics.

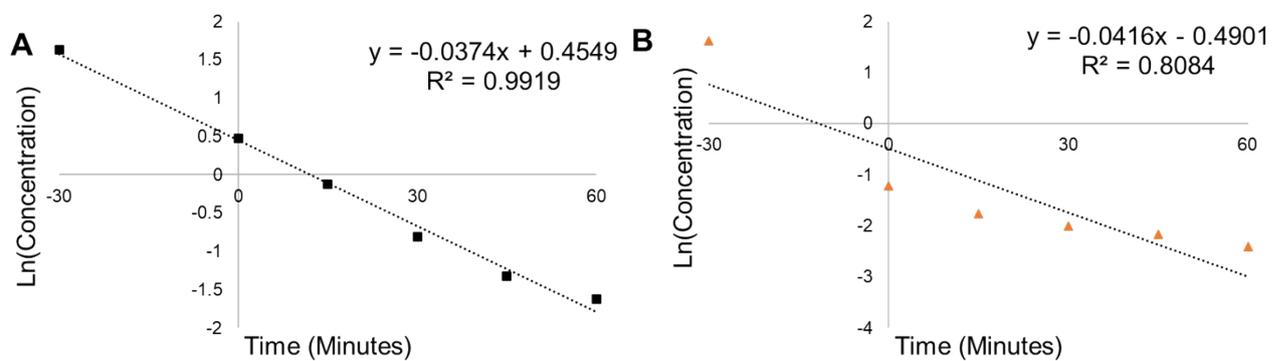

Figure S11: Natural logs vs. time for -30- 60 mins for A- Sample S and B- Sample ST80.

These were used to calculate rates of reaction between specific times.

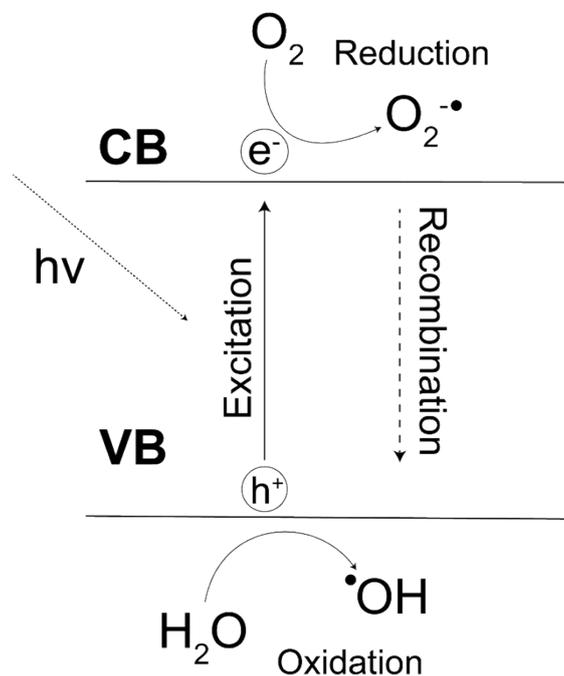

Figure S12: The proposed photocatalytic mechanism for the generation of OH^\bullet and $O_2^{\bullet-}$ radicals.

Table S1: Complete viscometry data for all templating solutions (after mixing at 1000 rpm at 80 °C).

Sample	KS80	V	VT80	S	ST80
Viscosity (cP)	3.12	12.2	23.2	7.92	18.1
Torque (%)	5.2	20.4	38	13.2	30.1
