Figure S5. Deconvolution results of the XPS spectra for SSGO TPDT 1x linker with 0.11, 0.33, and 0.55 ml of H_{2}O_{2}. Carbon 1s region (Left). Oxygen 1S region (Right).
Raman spectroscopy was performed on a HORIBA LabRAM HR Evolution Raman microscope with a 532 nm laser.

Figure S6 shows the Raman spectrum of SSGO TPDT with 0.11 ml and 0.55 ml of H₂O₂. The Raman spectra displays D and G peaks located at 1344 and 1592 cm⁻¹, respectively. The intensity ratios of I_D/I_G of SSGO TPDT with 0.11 ml and 0.55 ml of H₂O₂ are 0.84 and 0.83, respectively.
Figure S7 shows the Raman spectra of SSGO QPDT with 0.11 ml of H$_2$O$_2$. The Raman spectra indicates D and G peaks found at 1346 and 1593 cm$^{-1}$, respectively. The intensity ratio of I$_D$/I$_G$ of SSGO QPDT with 0.11 ml of H$_2$O$_2$ is 0.91.
The investigations of the thermal stability of the SSGO TPDT 1x linker with 0.55 ml of H\(_2\)O\(_2\) were performed using TGA. TGA was recorded on a TGA Q50 V20.13 system at the heating rate of 20K/min from 25-900 °C under air. The thermogravimetric curve showed two major weight drops. The first effect observed between the temperatures of 100 and 300 °C is associated with the thermal removal of oxygen functionalities (the decomposition of carboxylic) chemically bonded with graphene layers and the release of CO\(_2\) gas. The second significant loss of sample weight begins at the temperature of around 550 °C. This effect corresponds to the decomposition of graphene-like sheets.

Figure S8. TGA weight loss curve for SSGO TPDT with 0.55 ml of H\(_2\)O\(_2\).
Figure S9. TEM images of a) SSGO QPDT (1x linker) with 0.11 ml of H$_2$O$_2$ b) SSGO QPDT (1x linker) with 0.33 ml of H$_2$O$_2$ c) SSGO QPDT (1x linker) with 0.55 ml of H$_2$O$_2$. 

Figure S10. Deconvolution results of the XPS spectra for SSGO QPDT samples with 0.11, 0.33, and 0.55 ml of H₂O₂. Carbon 1s region (Left). Oxygen 1S region (Middle). Sulfur 2p region (Right).
