## General Experimental Methods

All reagents referred to in the experimental procedure were provided from Sigma-Aldrich or Fischer and were used as described with no means of purification before use. Microwave assisted techniques were conducted using a Biotage Initiator 2.5 Reactor with sealed and magnetically stirred glass tubes. NMR spectra were recorded using 300 MHz Bruker or 500 MHz Agilent spectrometers and referenced to the necessary residual solvent peaks. UV/Vis spectra measurements were obtained in DMSO using a Perkin Elmer Lambda 35 UV/VIS Spectrophotometer. The corresponding fluorimetry studies were recorded using a Perkin Elmer LS 55 Luminescence Spectrophotometer and further to this all quantum yield measurements were made with reference to a standard solution of  $[\text{Ru}(\text{bipy})_3](\text{PF}_6)_2$  in water (4.45  $\mu\text{M}$  concentration).

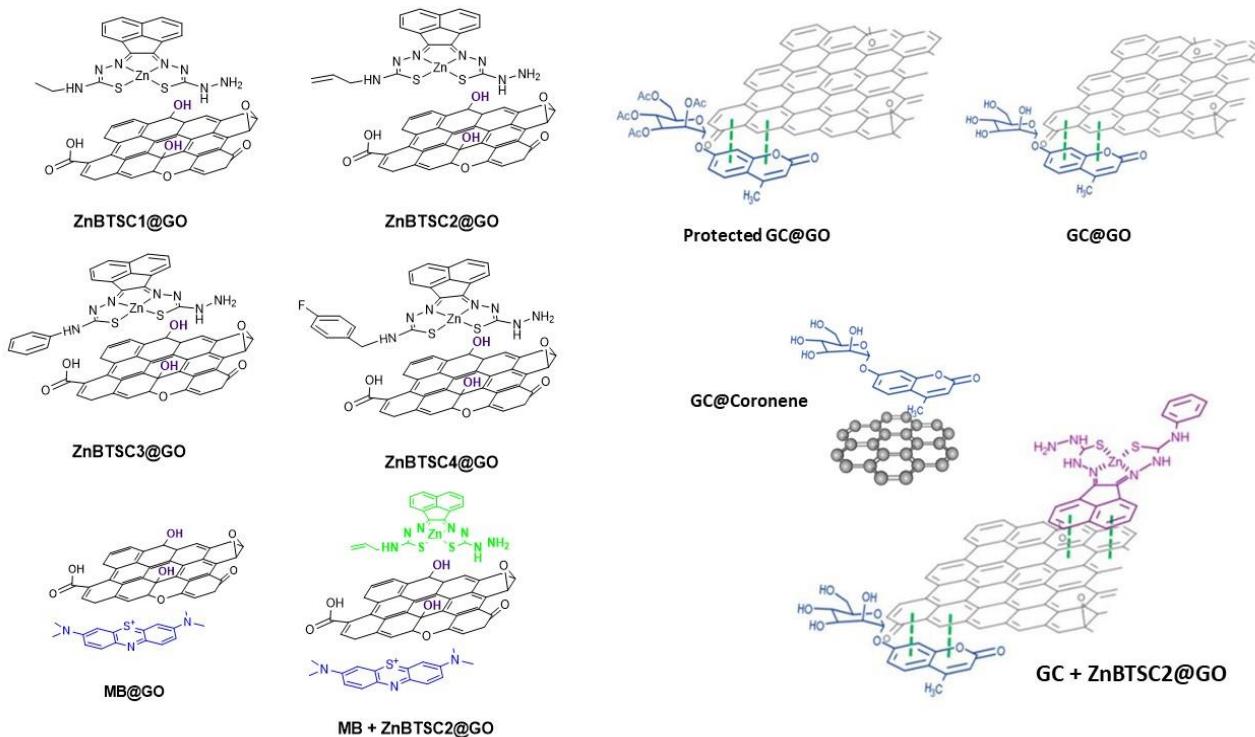

$$\phi_S = \phi_R \cdot \frac{D_S}{D_R} \cdot \frac{I_S}{I_R} \cdot \frac{A_S}{A_R} \cdot \left( \frac{\eta_S}{\eta_R} \right)^2 \quad (1)$$

Quantum yields were calculated using equation (1) where S is sample, R is reference, D = integrated area of fluorescence emission, I is the peak intensity of fluorescence, A is the peak Absorbance and  $\eta$  is the refractive index.

Transmission electron microscopy (JEOL JEN 2100 Plus) was used to image thin films (solvent evaporated) of samples on LACEY carbon grids. A Scanning Electron Microscope (JEOL JSM 648 OLV) was used to image samples that had been deposited on glass Mica sleeves with solvent evaporated or if a solid sample placed on carbon tape. All samples for imaging were coated with a 10 nm conductive thin film of chromium or gold. Further to this Energy Dispersive X-ray spectroscopy was recorded using the SEM with reference to a silica calibration sample. All samples were uncoated for EDX analysis.

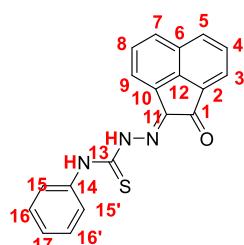

**Figure S1.** Schematic representation of small molecular synthetic building blocks used hereby.

**Figure S2.** Schematic representation of nanohybrids formed in the dispersed phase (aqueous DMSO) investigated hereby.

### Adapted synthesis of known monosubstituted ligands

#### Mono (substituted) 4-phenyl-3-thiosemicarbazone acenaphthenequinone:

A microwave tube was filled with acenaphthenoquinone (0.250g, 1.37 mmol), 4-phenylthiosemicarbazid (0.221 g, 1.37 mmol), 10 ml of Ethanol and 2 drops of concentrated HCl. The mixture was reacted at 90 °C in the microwave for 10 minutes. The slurry was then allowed to cool, filtrated, and washed with diethyl ether. The precipitate was collected to afford the desire compound (**7a**) in an orange colour with 58% yield. No further purification was necessary.

**<sup>1</sup>H NMR** (500MHz, DMSO)  $\delta_H$ : 12.85 (s, 1H, N-NH); 11.01(s, 1H, NH-Ph); 8.42(d, 1H, <sup>3</sup>J= 8.3Hz, **H**<sup>3</sup>); 8.16 (overlapping m, 3H, **H**<sup>7</sup>, **H**<sup>5</sup>, **H**<sup>9</sup>); 7.89 (overlapping t, 2H, **H**<sup>8</sup>, **H**<sup>4</sup>), 7.65 (obscured d, 2H, **H**<sup>15</sup> **H**<sup>15'</sup>), 7.47 (t, m-H, <sup>3</sup>J= 7.6 Hz, 8.3 Hz, 2H, **H**<sup>16</sup> **H**<sup>16'</sup>), 7.31 (t, <sup>3</sup>J= 7.6 Hz, 8.3 Hz, 1H, **H**<sup>17</sup>) ppm.

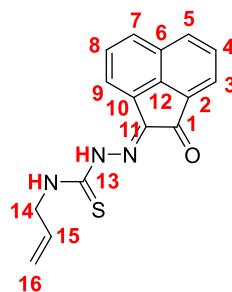

**<sup>13</sup>C NMR** (125MHz, DMSO)  $\delta_C$ : 189.12 (**C**=O); 177.11 (NHR-CS-NHPh); 139.87 (**C**=N-R); 137.34 (**C**<sup>2</sup>); 138.21 (**C**<sup>10</sup>); 133.33 (**C**<sup>3</sup>); 130.93 (**C**<sup>14</sup>); 130.44 (**C**<sup>5</sup>); 130.40 (**C**<sup>6</sup>); 129.42 (**C**<sup>8</sup>); 129.10 (**C**<sup>4</sup>); 128.91 (**C**<sup>16</sup>); 127.74 (**C**<sup>9</sup>); 126.64 (**C**<sup>17</sup>); 126.23 (**C**<sup>15</sup>); 123.03 (**C**<sup>7</sup>); 119.34 (**C**<sup>5</sup>).

**Mass Spectrometry:** ASAP for C<sub>19</sub>H<sub>13</sub>N<sub>3</sub>OS, calcd for ([M-H]<sup>+</sup>) 330.0696 amu found 330.0699 amu

**HPLC** (Method B): R<sub>f</sub>= 11.41 min

### Mono (substituted) 3-allyl-4-thiosemicarbazone acenaphthenequinone:

A microwave tube was filled with acenaphthenoquinone (0.500 g, 2.74 mmol), 4-phenylthiosemicarbazid (0.3595 g, 2.74 mmol), 15 ml of Ethanol and 0.1ml of concentrated HCl. The mixture was reacted at 90 °C in the microwave for 10 minutes. The slurry was then allowed to cool, filtrated and washed with diethyl ether. The precipitate was collected to afford the desired compound (**7b**) in an orange colour with 58% yield, which was used in subsequent reactions without further purification.

**<sup>1</sup>H NMR** (300MHz, DMSO-d<sub>6</sub>, 298 K) δ<sub>H</sub>: 12.63 (s, 1H, N-NH); 9.59(t, 1H, <sup>3</sup>J= 5.75Hz, 11.37Hz, NH-Allyl); 8.36 (d, <sup>3</sup>J= 8.19Hz, 1H, **H**<sup>3</sup>); 8.11 (overlapping d, <sup>3</sup>J= 8.19Hz, 1H,**H**<sup>7</sup>), 8.08 (overlapping d, <sup>3</sup>J= 6.39 Hz, 1H,**H**<sup>5</sup> ), 7.84 (overlapping m, 2H, **H**<sup>4</sup>, **H**<sup>8</sup>), 5.96 (m, 1H, NH-CH<sub>2</sub>-R), 5.22 (d, <sup>3</sup>J= 16.5Hz, 1H, RCH-CH<sub>2</sub>); 4.30 (t, 1H, , <sup>3</sup>J= 4.9 Hz, 9.9Hz, R-CH-CH<sub>2</sub>).

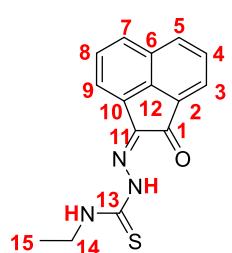

**<sup>13</sup>C NMR** (125MHz, DMSO) δ<sub>C</sub>: 188.55 (**C**=O); 177.56 (NHR-CS-NHAllyl); 139.15 (**C**<sup>I2</sup>); 137.34 (**C**<sup>2</sup>); 134.01 (R-CH-CH<sub>2</sub>); 132.79 (**C**<sup>3</sup>); 130.46 (**C**<sup>I0</sup>); 130.06 (**C**=N-R); 129.90(**C**<sup>6</sup>); 128.90 (**C**<sup>4</sup>); 128.61 (**C**<sup>I1</sup>); 127.10 (**C**<sup>7</sup>); 122.49 (**C**<sup>5</sup>); 118.37 (**C**<sup>9</sup>); 116.31 (RCH-CH<sub>2</sub>); 46.46 (NH-CH<sub>2</sub>-R) ppm.

**Mass Spectrometry** (ASAP) for C<sub>16</sub>H<sub>13</sub>N<sub>3</sub>OS, calcd for ([M-H]<sup>+</sup>) 294.0691 amu found 294.0696 amu

**HPLC** (Method A): R<sub>f</sub>= 10.82 min

### Mono (substituted) 3-ethyl-4-thiosemicarbazone acenaphthenequinone:

A microwave tube was filled with acenaphthenoquinone (0.500 g, 2.74 mmol), 4-ethylthiosemicarbazide (0.3259 g, 2.74 mmol), 15 ml of Ethanol and 0.1ml of concentrated HCl. The mixture was reacted at 90 °C in the microwave for 10 minutes. The slurry was then allowed to cool, filtrated and washed with diethyl ether. The precipitate was collected to afford the desired compound (**7c**) in an orange colour with 84% yield. No further purification was necessary.

**<sup>1</sup>H NMR** (300MHz, DMSO-d<sub>6</sub>, 298 K) δ<sub>H</sub>: 12.59 (s, 1H, N-NH); 9.44 (t, 1H, <sup>3</sup>J= 5.44 Hz, 10.66 Hz, NH-Et); 8.36 (d, <sup>3</sup>J= 8.27 Hz, 1H, **H**<sup>3</sup>); 8.12 (overlapping d, <sup>3</sup>J= 8.49Hz, 1H,**H**<sup>7</sup>), 8.08 (overlapping d, <sup>3</sup>J= 6.96 Hz, 1H,**H**<sup>5</sup> ), 7.99 (d, <sup>3</sup>J=6.96 Hz, 1H, **H**<sup>9</sup>), 7.84 (overlapping m, 2H, **H**<sup>4</sup>, **H**<sup>8</sup>), 3.66 (q, 2H, NH-CH<sub>2</sub>-CH<sub>3</sub>), 1.20 (t, 1H, , <sup>3</sup>J= 7.08 Hz, 14.09 Hz, 3H, R-CH<sub>3</sub>).

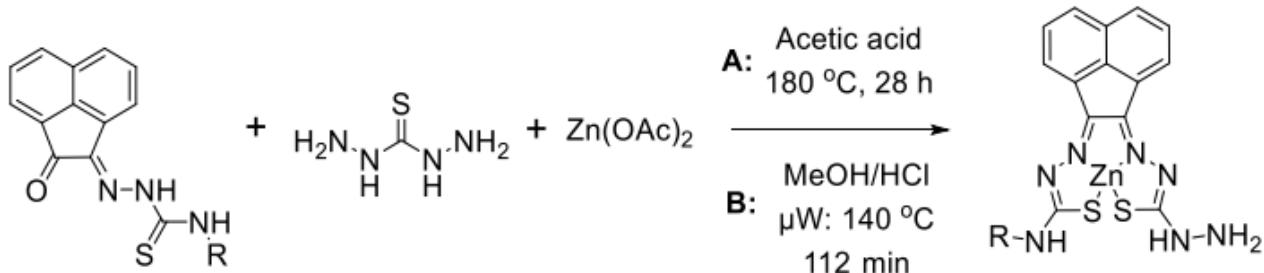

**<sup>13</sup>C NMR** (125MHz, DMSO) δ<sub>C</sub>: 188.91 (**C**=O); 177.21 (NHR-CS-NHEt); 139.44 (**C**<sup>I2</sup>); 137.53 (**C**<sup>2</sup>); 133.14 (**C**<sup>3</sup>); 130.84 (**C**<sup>I0</sup>); 130.46 (**C**=N-R); 130.26(**C**<sup>6</sup>); 129.27(**C**<sup>I1</sup>); 128.98 (**C**<sup>4</sup>, **C**<sup>8</sup>); 127.41 (**C**<sup>7</sup>); 122.84 (**C**<sup>5</sup>); 118.63 (**C**<sup>9</sup>); 14.45 (RCH<sub>2</sub>-CH<sub>3</sub>); ppm.

**Mass Spectrometry:** ASAP for C<sub>15</sub>H<sub>13</sub>N<sub>3</sub>OS, calcd for ([M+H]<sup>+</sup>) 284.0858 amu found 284.0855 amu

**HPLC** (Method A): R<sub>f</sub>= 10.71 min

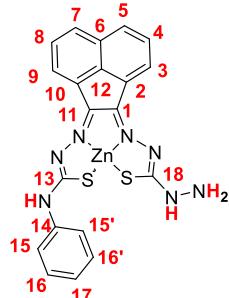

**Synthesis of Zn(BTSC) complexes:**

**Scheme S1.**

**General considerations:** To decrease the time of the reaction, microwave radiation was introduced as the energy source. The microwave-assisted reaction proved to be rather challenging, and optimising the working conditions was necessary. Then the reactions were successfully performed (Scheme S1, method B) with most of the compounds being obtained pure and in high yields as described below. Among the relevant points for successful optimisation are: avoid temperatures higher than  $140^\circ\text{C}$ , mix the mono(substituted) ligand with the zinc acetate prior to the addition of the thiocarbohydrazide in the reaction (as for conventional heating), and lastly, replacement of acetic acid by slightly acidic methanol (0.01% v/v HCl in methanol). More specifically, the reactions for the synthesis of metal asymmetric thiosemicarbazones were carried out as follows: a microwave vial was filled with  $\text{Zn}(\text{OAc})_2$ , in methanol, and heated (conventional heating) to  $60^\circ\text{C}$ . Then, the monosubstituted ligand was added and the temperature was increased to  $120^\circ\text{C}$ . When the reaction reached  $120^\circ\text{C}$ , the thiosemicarbohydrazide was added along with a drop of HCl (37%). Following, the reaction was allowed to react at  $140^\circ\text{C}$  (under microwave radiation) for 112 minutes. The crude product was then filtered and washed with cold methanol and diethyl ether to remove any traces of the starting materials.

**Zinc(II) 4-phenyl-3-thiosemicarbazone-thiocarbohydrazide acenapthenoquinone (ZnBTSC3):**

In a microwave vial 3 mL of EtOH were added and heated to  $60^\circ\text{C}$ . To this, zinc acetate (0.2768 g, 1.50 mmol) was added along with 4-phenyl-3-thiosemicarbazone acenapthenoquinone (**3a**) (0.1 g, 0.31 mmol). Then the reaction was heated further to  $120^\circ\text{C}$  and thiosemicarbohydrazide (0.0961 g, 0.91 mmols) was added together with 2 mL of EtOH and couple of drops of HCl. The reaction mixture was heated under  $\mu\text{W}$  radiation at  $150^\circ\text{C}$  for 106 min. Then was filtrated hot, re-suspended in diethyl ether (100 ml), stirred for another 15min and filtrated under vacuum. Resulting deposit was further washed with diethyl ether (200 ml) and Zinc (II) 4-phenyl-3-thiosemicarbazone-thiocarbohydrazide acenapthenoquinone (**6a**) was isolated as an orange colour solid with a yield of 95 % (0.1599 g).

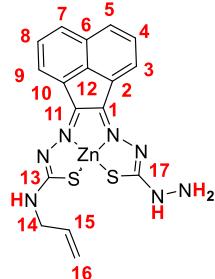

**$^1\text{H NMR}$**  (500MHz, DMSO-d<sub>6</sub>, 298 K)  $\delta_H$  : 9.92 (s, 1H, NH-Ph); 8.64 (s, 1H,  $\text{H}^3$ ); 8.64 (s, 1H,  $\text{H}^9$ ); 7.93 (d overlapping, 2H,  $\text{H}^5$ ,  $\text{H}^7$ ), 7.68 (overlapping, 3H,  $\text{H}^8$ ,  $\text{H}^{15}$   $\text{H}^{15'}$ ); 7.48 (t,  $^3J=8.1$ , 16.3Hz, 1H,  $\text{H}^4$ ), 7.44 (t,  $^3J=7.8$ , 15.6Hz, 2H,  $\text{H}^{17}$ ); 7.14 (t,  $^3J=7.3$ , 14.6Hz, 1H,  $\text{H}^{16}$   $\text{H}^{16'}$ ); 6.78 (s, 2H, NH<sub>2</sub>).

**HPLC** (Method A):  $R_f = 11.55, 12.13$  min

## Zinc(II) 3-allyl-3-thiosemicarbazone-thiocarbohydrazide acenapthenoquinone (ZnBTSC2):

In a microwave vial 3 mL of EtOH were added and heated to 60 °C. To this, zinc acetate (0.3106 g, 1.69 mmol) was added along with 3-allyl-3-thiosemicarbazone acenapthenoquinone (**3b**) (0.1 g, 0.35 mmol). Then the reaction was heated further to 120 °C and thiosemicarbohydrazide (0.1091 g, 1.06 mmols) was added together with 2 mL of EtOH and couple of drops of HCl. The reaction mixture was heated under  $\mu$ W radiation at 150 °C for 106 min. Then was filtrated hot, re-suspended in diethyl ether (100 ml), stirred for another 15 min and filtrated under vacuum. Resulting deposit was further washed with diethyl ether (200 ml) and Zinc (II) 3-allyl-3-thiosemicarbazone-thiocarbohydrazide acenapthenoquinone (**6b**) was isolated as an orange colour solid with a yield of 86 % (0.135 g).

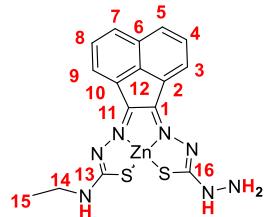

**1H NMR** (500MHz, DMSO-d<sub>6</sub>, 298 K)  $\delta$ : 8.58 (bs, 1H, NH-Allyl); 8.33 (bs, 1H, **H**<sup>3</sup>); 7.94 (3H, **H**<sup>1</sup>, **H**<sup>2</sup>, **H**<sup>2'</sup> overlapping), 7.67 (3H, **H**<sup>1'</sup>, **H**<sup>3</sup>, **H**<sup>3'</sup> overlapping); 6.58 (bs, 2H, NH<sub>2</sub>); 6.03 (bs, 1H, RCH=CH<sub>2</sub>); 5.30 (d, 1H, <sup>3</sup>J= 1.6 Hz, RCH=CH<sub>2</sub>); 5.15 (d, 1H, <sup>3</sup>J= 10.7Hz, RCH=CH<sub>2</sub>); 4.19 (bs, 1H, NHCH<sub>2</sub>R) ppm.

**Mass Spectrometry:** MALDI-MS for C<sub>17</sub>H<sub>15</sub>N<sub>7</sub>S<sub>2</sub>Zn, calcd for ([M]<sup>+</sup>) 445 amu found 445 amu and for ([M+H]<sup>+</sup>) 446 amu found 446 amu.

## Zinc(II) 3-ethyl-3-thiosemicarbazone-thiocarbohydrazide acenapthenoquinone (ZnBTSC1):

In a microwave vial 3 mL of EtOH were added and heated to 60 °C. To this, zinc acetate (0.3241 g, 1.77 mmol) was added along with 3-ethyl-3-thiosemicarbazone acenapthenoquinone (**3c**) (0.1 g, 0.35 mmol). Then the reaction was heated further to 120 °C and thiosemicarbohydrazide (0.1125 g, 1.06 mmols) was added together with 2 mL of EtOH and couple of drops of HCl. The reaction mixture was heated under  $\mu$ W radiation at 150 °C for 106 min. Then was filtrated hot, re-suspended in diethyl ether (100 ml), stirred for another 15min and filtrated under vacuum. Resulting deposit was further washed with diethyl ether (200 ml) and Zinc (II) 3-allyl-3-thiosemicarbazone-thiocarbohydrazide acenapthenoquinone (**6b**) was isolated as an orange colour solid with a yield of 86 % (0.135 g).

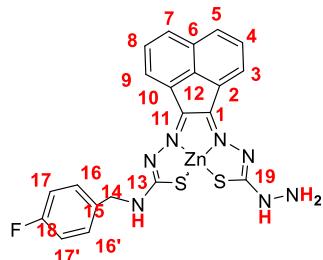

**1H NMR** (500MHz, DMSO-d<sub>6</sub>, 298 K)  $\delta$ : 8.98 (bs, 1H, NH-Ethyl); 8.22 (bs, 1H, NH-NH<sub>2</sub>); 8.62 (, 2H, **H**<sup>3</sup>, **H**<sup>9</sup> overlapping); 7.96 (2H, **H**<sup>5</sup>, **H**<sup>7</sup> overlapping), 7.68 (2H, **H**<sup>4</sup>, **H**<sup>8'</sup> overlapping); 6.58 (bs, 2H, NH<sub>2</sub>); 6.03 (bs, 1H, RCH=CH<sub>2</sub>); 5.30 (d, 1H, <sup>3</sup>J= 1.6 Hz, RCH=CH<sub>2</sub>); 5.15 (d, 1H, <sup>3</sup>J= 10.7Hz, RCH=CH<sub>2</sub>); 4.19 (bs, 1H, NHCH<sub>2</sub>R) ppm.

**13C NMR** (125MHz,  $\delta$ <sub>C</sub>: 176.7 (RN=CS-NHbnzF); 176.6 (RN=CS-NHNH<sub>2</sub>); 146.39 (**C**<sup>II</sup>); 138.1 (**C**<sup>I</sup>); 135.4 (**C**<sup>2</sup>); 135.3 (**C**<sup>10</sup>); 131.3 (**C**<sup>12</sup>); 128.7 (**C**<sup>8</sup>) 128.3 (**C**<sup>4</sup>); 127.7 (**C**<sup>7</sup>); 126.7 (**C**<sup>5</sup>); 126.1 (**C**<sup>9</sup>); 130.0 (**C**<sup>14</sup>); 38.3 (**C**<sup>14</sup>) 15.0(**C**<sup>15</sup>) ppm,

**HPLC** (Method A): R<sub>f</sub>= 12.34 min

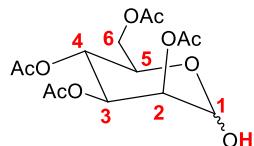

## Synthesis and functionalization of glycosyl coumarin derivatives

The synthetic protocols were carried out using an adapted protocol based on that previously reported<sup>2</sup>.

**Scheme S2**

### Synthesis of 2,3,4,6-Tetra-O-acetyl-D-mannopyranose:

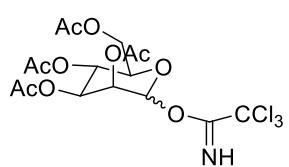

$\alpha$ -D-mannose pentaacetate (d) (3.0 g, 7.69 mmol) was dissolved in dry DCM (30 mL). Morpholine (2.68 ml, 30.75 mmol) was then added and the reaction mixture was let under N<sub>2</sub> at room temperature, overnight. The slurry was first washed with HCl solution (1 N) (2\*30 ml), then with distilled water (3\*30 ml) and finally dried over magnesium sulphate. The excess solvent was removed under reduced pressure to afford 2,3,4,6-Tetra-O-acetyl-D-mannopyranose (**1**) as a light yellow oil at room temperature, which was used without any further purification. (2.16 g, 71 %).

## Synthesis of 2,3,4,6-Tetra-O-acetyl-D-mannopyranose trichloroacetamide:

2,3,4,6-Tetra-O-acetyl-D-mannopyranose (**1**) (2.15 g, 6.17 mmol) and trichloroacetonitrile (2.19 mL, 6.17 mmol) were dissolved in dry DCM (30 ml) and the reaction mixture was let under N<sub>2</sub> at 0 °C for 1 h. then a catalytic amount of DBU (0.19 mL, 1.23 mmols) was added and slurry was stirred for further 30 min under N<sub>2</sub> at 0 °C. The excess solvent was removed under reduced pressure to afford a crude compound of 2,3,4,6-Tetra-O-acetyl-D-mannopyranose trichloroacetamide as a yellow oil at room temperature, which was used without any further purification.

## Synthesis of 4- Methylumbelliferyl-7-yl-2,3,4,6-Tetra-O-acetyl- α -D-mannopyranose:

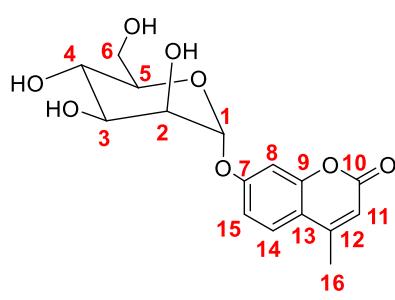

The crude 2,3,4,6-Tetra-O-acetyl-D-mannopyranose-trichloroacetamide (**2**) was dissolved in dry DCM (40 mL). 4-Methylumbelliferylene (**3**) (2.28 g, 6.17 mmols) was added to the slurry along with boron trifluoride metharate (0.11 mL, 1.2 mmol) and the reaction mixture was let under N<sub>2</sub> at 23 °C over night. The slurry was first diluted with 10 ml of DCM, then washed with HCl solution (1N) (2\*20 ml) and distilled water (3\*20 ml) and dried over magnesium sulphate. The excess solvent was removed under reduced pressure. The crude product was then purified by crystallisation with methanol to afford 4-Methylumbelliferyl-7-yl-2,3,4,6-Tetra-O-acetyl- α -D-mannopyranose as a white solid (2.47 g, 40 %).

## 4-methylumbelliferyl-7-yl-α-D-mannopyranose:

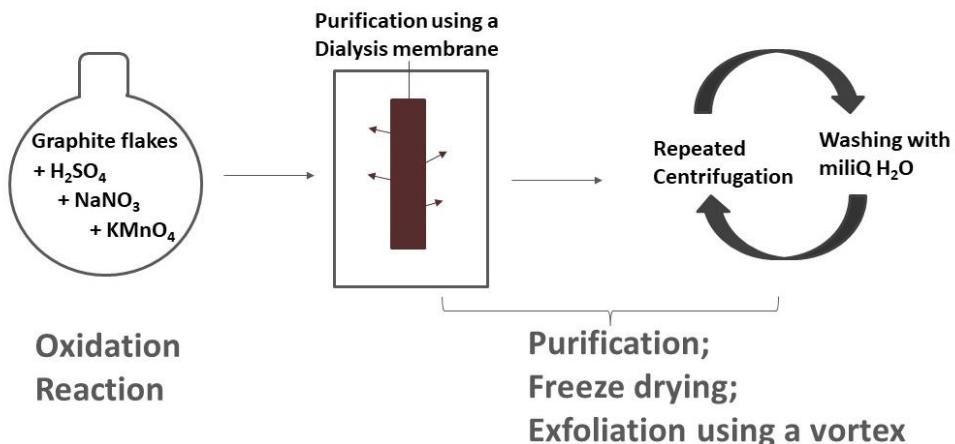

4- Methylumbelliferyl-7-yl-2,3,4,6-Tetra-O-acetyl- α -D-mannopyranose (**4**) (0.32 g, 0.64 mmol) was added in a solution of sodium methoxide (0.061 g, 0.96 mmol) in dry methanol (7 ml). The reaction mixture was stirred under N<sub>2</sub> at room temperature for 30 min. The crude product was purified by crystallisation with methanol. The solid was removed by filtration and the excess solvent of filtrate was removed by reduced pressure to afford the desired compound (**5**) as an off white oil (0.2 g, 93%).

## Preparation of Graphene Oxide by the adapted Hummer's Method

**Scheme S3**

Graphene flakes (0.250 g, 20.82 mmol) was placed in a round bottom flask (250 mL) with a magnetic stirrer bar and placed in a dry ice bath. Sulfuric acid (95 %, 5.75 mL) was added dropwise to the flask, followed by sodium nitrate (0.125 g, 1.47 mmol) and the reaction mixture was then stirred for 30 minutes in the ice bath. Over the duration of a one-hour period potassium permanganate (0.750 g, 4.75 mmol) was added slowly to the reaction mixture. The ice bath was then removed and the reaction mixture was heated to 45°C and stirred for 1 hour, milli-Q water (15 mL) was added and then stirred for 30 minutes further. To end the reaction milli-Q water (30 mL) with hydrogen peroxide (3 %, 7.5 mL) was added to the mixture.

The reaction mixture was pipetted into dialysis membranes which were then sealed with clips and placed into the dialysis vessel and left for 42 hours to remove salt impurities from the graphene oxide. The membranes were then emptied into a beaker and rinsed with milli-Q water. The reaction mixture was then pipetted into Eppendorf centrifuge tubes and centrifuged (3000 rpm) for 5 minutes, the supernatant was discarded and the graphene oxide wet solid was washed with water. The samples were sonicated to mix the graphene oxide solid with the fresh water, and then centrifuged again. This process was repeated twice more, and then the solid was transferred in the minimum amount of water into one single vial, which was then freeze dried overnight.

**IR (cm<sup>-1</sup>):** 3147 ν(O-H), 2129 ν(CO<sub>2</sub>), 1722 ν(C=O), 1647 ν(C=C), 1387 ν(C-O), 968 ν(C-O).

### ***Preparation of [Zn(BTSC)]-graphene oxide nanocomposites***

In typical coordination experiment, the [Zn(BTSC)] complex (with R = Et, Allyl, Ph, and F-BzPh, each in 20 mg/ DMSO mL) and 20 mg of GO nanocomposites suspended in 1 mL of DMSO were mixed, and the resulted dispersion was diluted further with 2 mL of EtOH and 1 mL of NaHCO<sub>3</sub> buffer in order to adjust the pH to 5.5. The mixture was allowed to react at 100 °C for 2.5 h, when it was allowed to cool down, centrifuged, washed with EtOH and H<sub>2</sub>O and allowed to freeze-dry overnight, prior to investigations by TEM and SEM.

### ***Fluorescence titration experiments.***

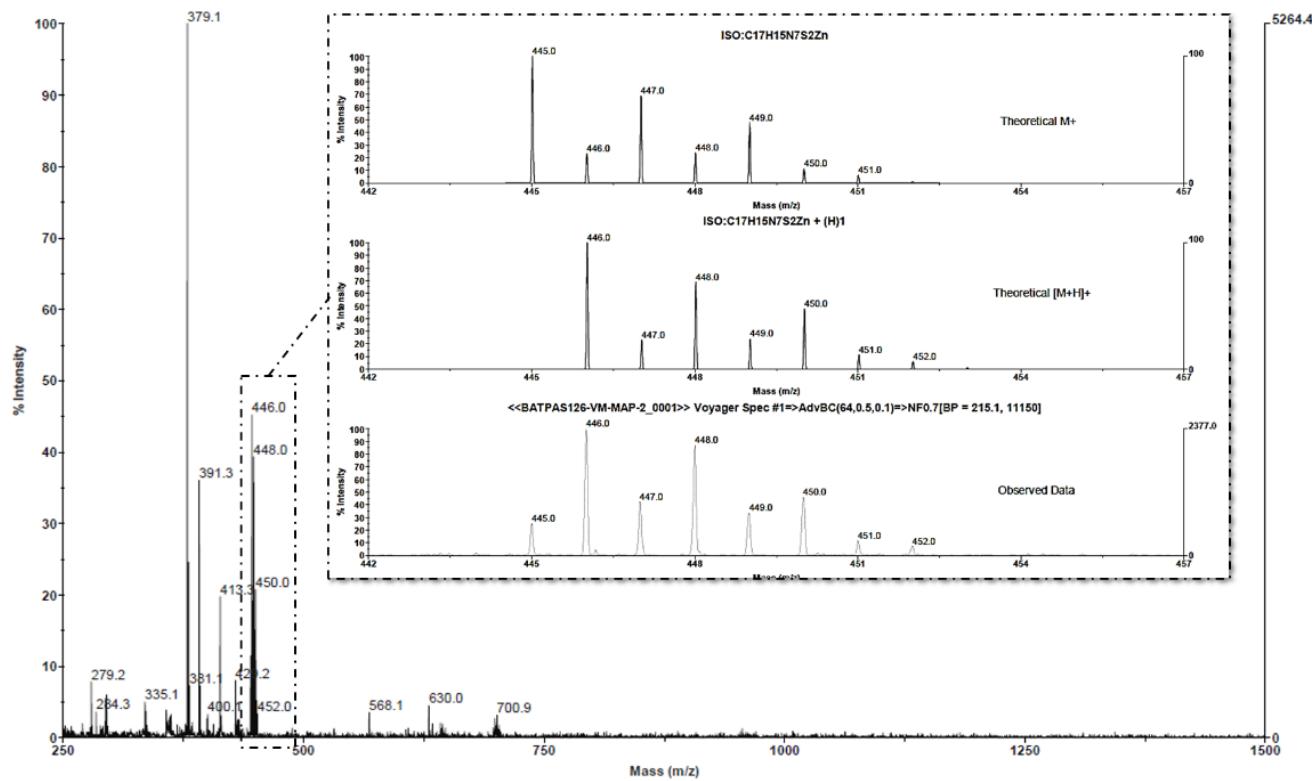

Fluorescent titration of a GO dispersion with an Acetyl Glycosyl Coumarin solution.

A 1 mM solution of Acetyl-protected Glycosyl Coumarin (AcGC), (5) was prepared. To this solution was added a saturating quantity of GO (1 mg/mL). The resulting saturated suspensions were then sonicated until the mixtures became homogeneous. The excess of coronene was allowed to settle. The resulting suspension supernatant was titrated against another 1 mM solution of Ac-protected GC (5) in DMSO. Excitation wavelength was set at 310 nm for all experiments. An emission range 330-600 nm was scanned at 500 nm cm<sup>-1</sup> for all experiments. Titrations were conducted in a 1.2 mL cuvette. Suspension containing AcGC (5) at 1 mM concentration in DMSO was added to the cuvette and the emission spectrum scanned. Subsequent scans were conducted with 50 µL aliquots removed from cuvette and replaced with 50 µL aliquots of 1 mM AcGC (5) suspension saturated with GO to maintain constant AcCG (5) concentration throughout the experiments. The resulting saturated suspension was well mixed before and after the addition of the saturated suspension of GC and GO, and the dispersions were allowed to settle before each measurement for 5 min.

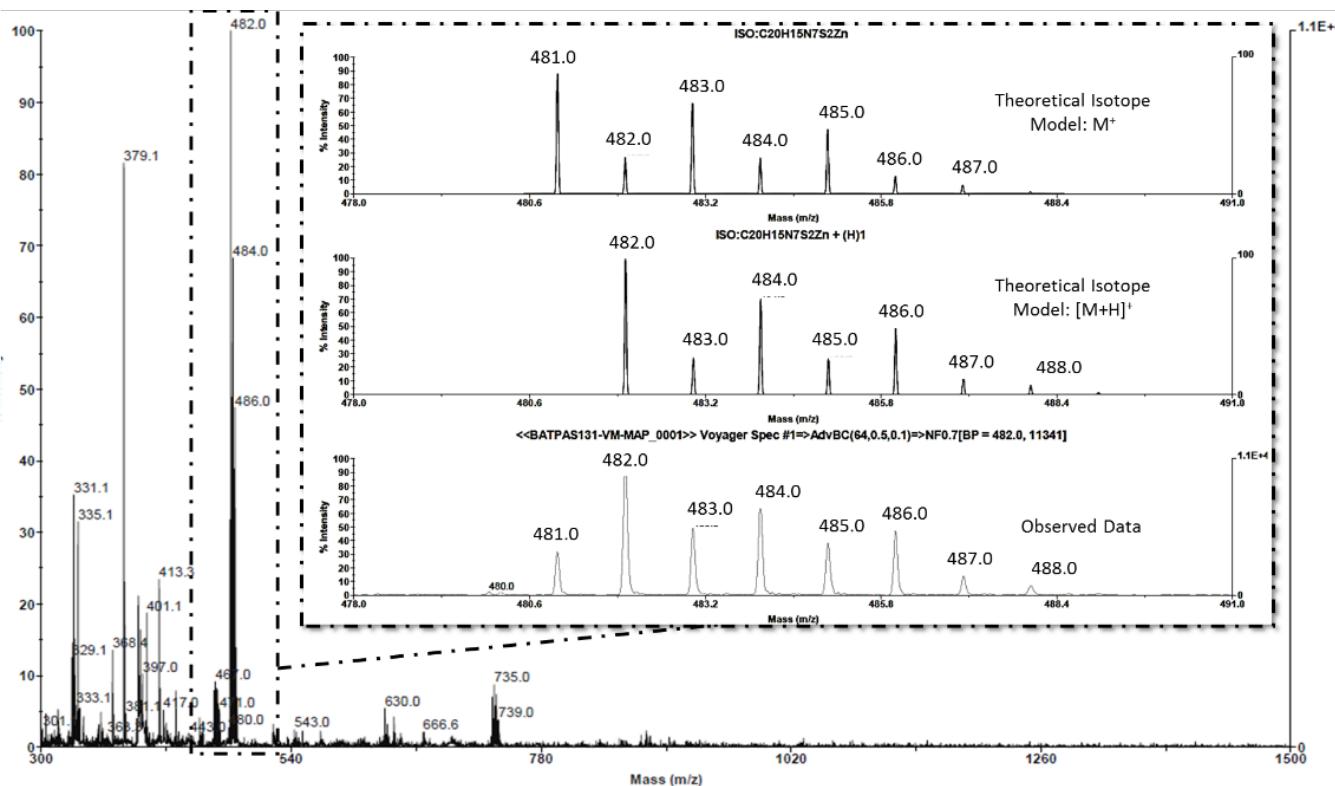

#### ***Evaluation of binding stoichiometry between glycosyl coumarin and coronene***

To a 0.125 mM solution of glycosyl coumarin, GC (4) coronene was added until the maximum concentration was reached in which the suspension was stable (0.125 mM). The resulting concentrated suspensions were then sonicated until the mixtures became homogeneous. The excess of coronene was allowed to settle. The resulting suspension supernatant was titrated against another 0.125 mM solution of GC (4) in DMSO. Excitation wavelength was set at 310 nm for all experiments. An emission range of 330-600 nm was scanned at 100 nm min<sup>-1</sup> for all experiments. Titrations were conducted in a 1.4 mL cuvette. A suspension containing GC (4) at 0.125 mM concentration in DMSO was added to the cuvette and the emission spectrum scanned. Subsequent scans were conducted with 5 µL to 100 µL aliquots removed from the cuvette and replaced accordingly with the corresponding aliquot of 0.125 mM GC (4) as a suspension saturated with coronene to maintain constant CG (4) concentration throughout the experiments. The resulting saturated suspension was well mixed before and after the addition of the saturated suspension of GC and coronene and prior to fluorescence and UV-vis spectroscopy.

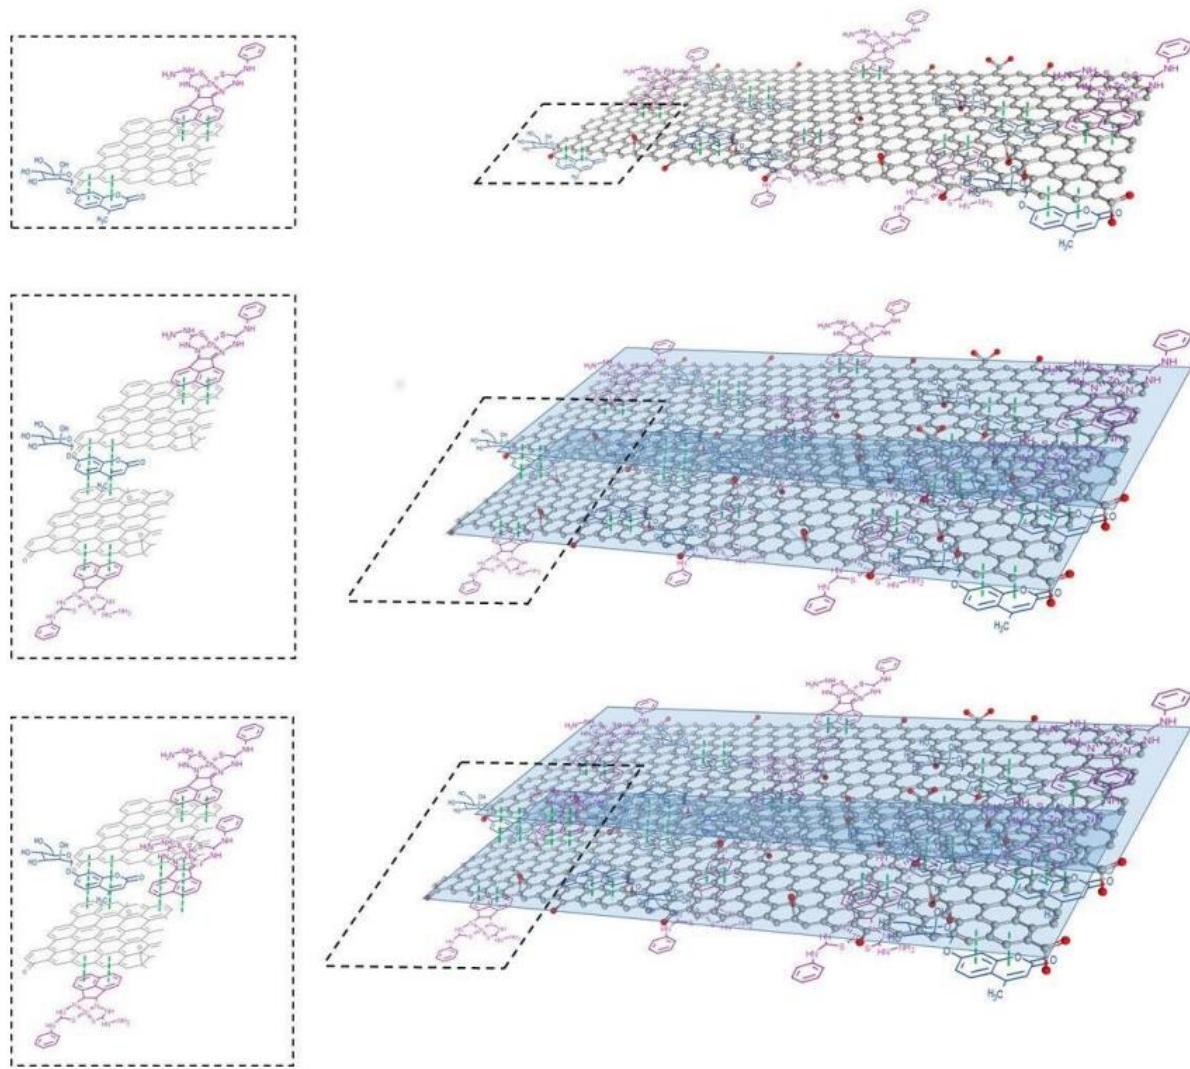

**Figure S43.** Fluorescence emission quenching experiment of a solution of GC (**4**) (0.3 mM) during titration experiment with **ZnBTSC3@GO** nanocomposite (mg/mL) in DMSO. The inset shows the normalised fluorescence emission intensity of the two maximum emission peaks at the relevant concentrations.

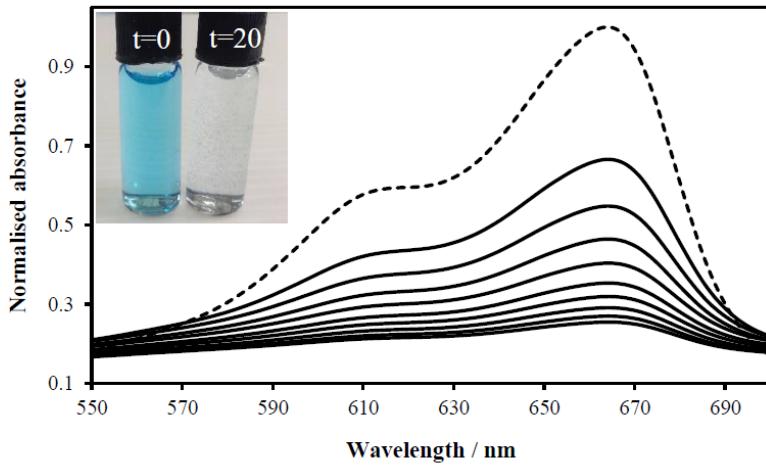

*Note:* The emission intensity that corresponds to compound 4 (GC) (lighter-blue line, max emission 400 nm, and also 730 nm) was reduced upon addition of the nanohybrid ZnBTSC3@GO in a DMSO suspension, and occurrence of a new fluorescence maximum (broad, ca 500-700 nm) was observed. The maximum fluorescence intensity of this emission band does not occur at the same wavelength as the free ZnBTSC3@GO (550 nm -700 nm) which suggests that complexation occurs, but also gives rise to a range of different supramolecularly aggregated species. As the titration proceeds, this new emission band is quenched, suggesting a rearrangement of the formed complex GC@ZnBTSC3@GO and significant self-aggregation. The inset graph depicts the normalised intensity of both emission bands at the relevant concentration of the complex ZnBTSC3@GO and points to a correlation between the increasing fluorescence intensity of the one emission band and the decreasing fluorescence intensity of the other.

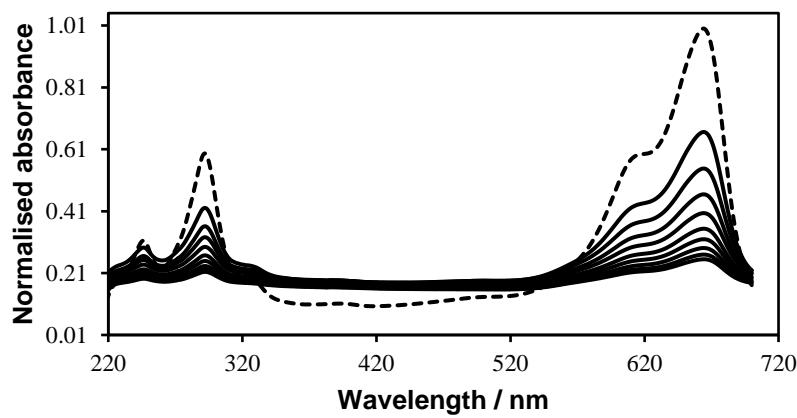

**Figure S44.** Normalised ratio of the initial emission intensity to the partial intensity for the two fluorescence maxima in Figure S43, at the relevant concentration for complex PhZnTSCAc @GO. The graph shows the normalised ratio between the initial fluorescence absorption of each peak to the partial intensity of it at the relevant complex PhZnTSCAc @GO concentration and it shows that the second emission band only increases its fluorescence intensity after the quenching of the first one. These results suggest that the formed hybrid has complex supramolecularly aggregated nature and a diverse variety of arrangements (Figure S44) are likely to form due to the non-covalent binding between complex PhZnTSCAc@GO and compound 4 (GC). These complex species in equilibrium may well be responsible for the rapid immobilization of such dyes in the nanohybrid.

**MB with ZnBTSC2 in DMSO:H<sub>2</sub>O 1:1****3h irradiation (violet light)**

**Figure S48.** (a-d) Overview of the UV-Vis data collected over 2-3 hours under a series of conditions and corresponding estimation of pseudo-first order kinetics behavior: (a) Methylene blue irradiated in the presence of ZnBTSC2 over 2 h with violet light (in DMSO:H<sub>2</sub>O 1:1); (b) Methylene blue irradiated in the presence of ZnBTSC2@GO over 2 h. Dotted lines represent correspondingly the absorption of the original free MB solution, and of the MB onto ZnBTSC2@GO prior to irradiation. (c) Absorption of MB on GO without irradiation monitored over 3 h, in DMSO:H<sub>2</sub>O; Inset: the dispersion of MB onto GO after 24 h, expansion of the normalized absorption axis; (d) Absorption of MB on ZnBTSC2@GO without irradiation monitored over 2 h, with detailed view of first 20 min. Black line represents free B under the same conditions. (e-g) Pseudo-first order behaviour of MB under the various conditions tested. Whilst the behaviour of MB with ZnBTSC2@GO in DMSO:H<sub>2</sub>O 1:1 under 3h irradiation (violet light) also displayed a similar trend (with ca  $8 \times 10^{-6}$  rate), the  $R^2$  was ca. 0.7.

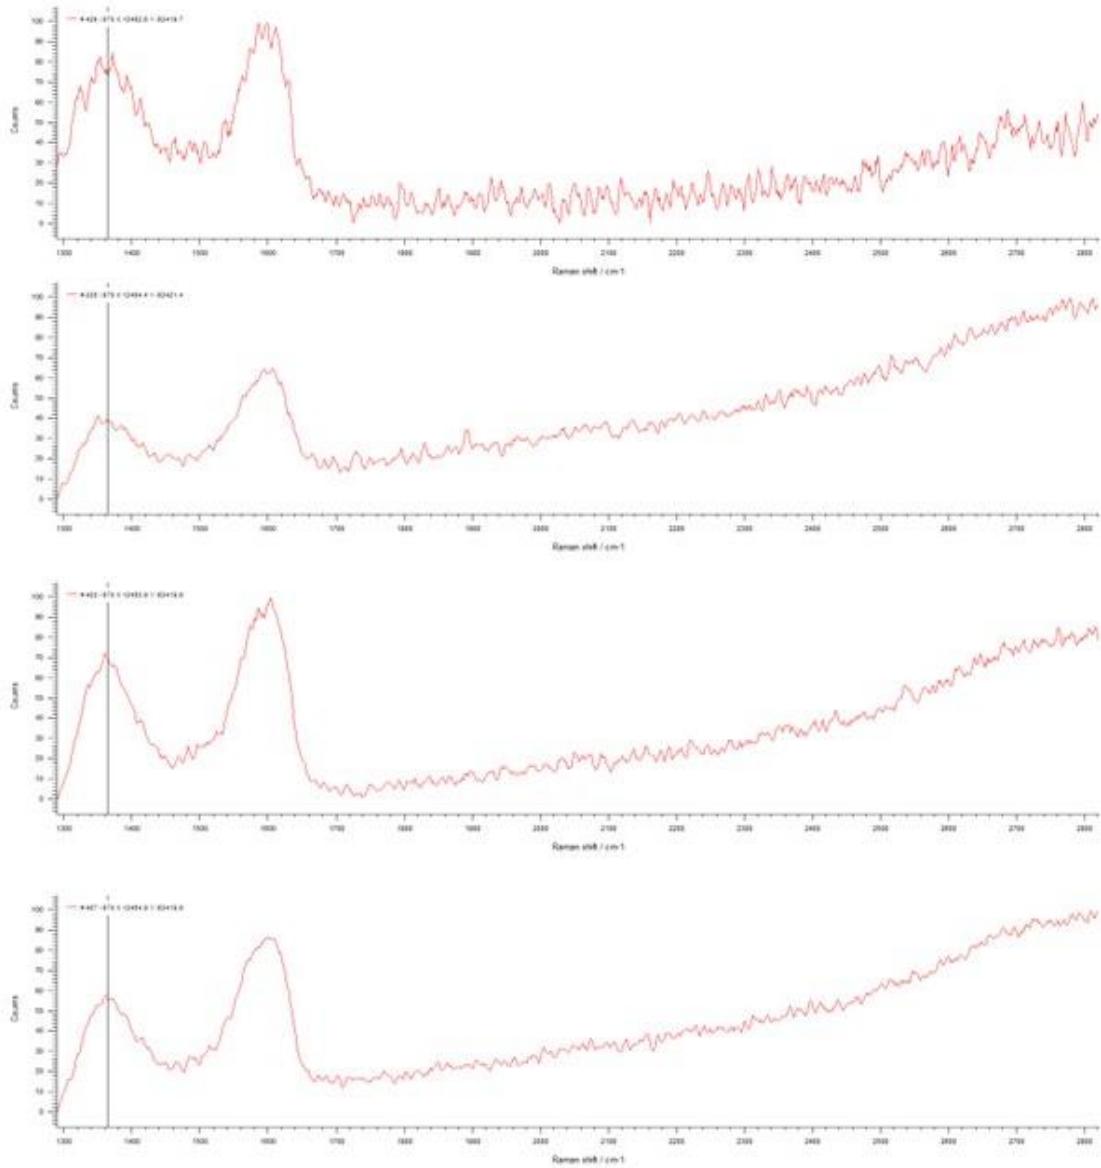

### Selected solid state characterisation data

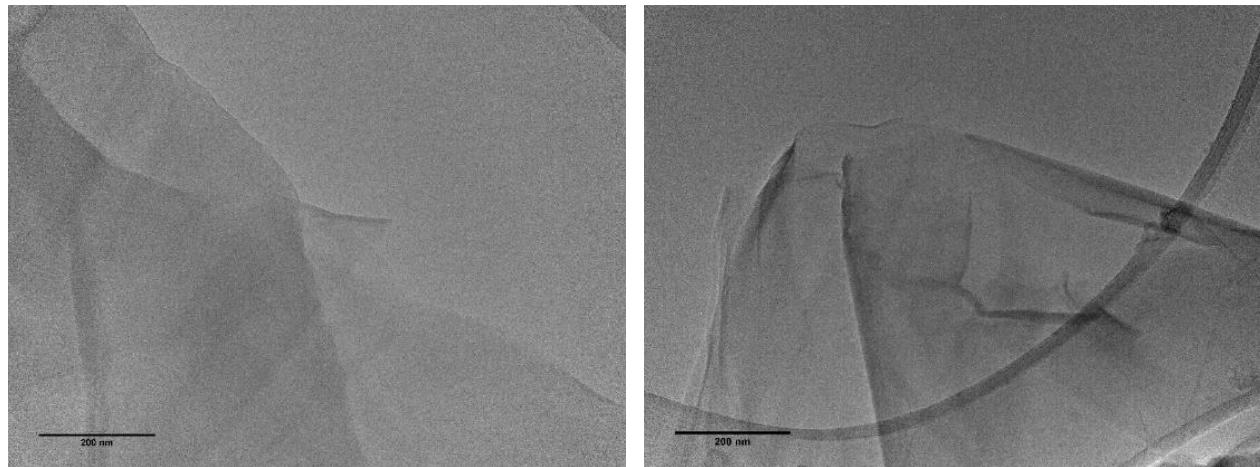

**Figure S49:** Raman (a) and solid state IR (b) spectroscopies of the as-synthesised GO nanoflakes (black lines) and pristine graphite starting material (red lines). (c) Raman map of a selected GO nanoflake (the 2D-mapping, left); the red-colour scale corresponds to the energy of the *G band* of GO ( $1601 \text{ cm}^{-1}$ ) and the colour scale represented in blue corresponds to the energy of the *D band* ( $1367 \text{ cm}^{-1}$ ). In the Raman spectroscopy 2D-mapping, each colour scale selected was represented in 4 different colours, from the darkest to the lightest shade, corresponding to diverse depth of the flake and, for each selected depth, the corresponding Raman spectra are given in Figures S50 and S51. As expected, in the Raman spectrum of graphite, the *G band* at  $1582.10 \text{ cm}^{-1}$  is due to the symmetry of hexagonal lattice; the  $2D_1$  and  $2D_2$  bands at  $2688.28 \text{ cm}^{-1}$  and  $2722.40 \text{ cm}^{-1}$ , respectively, due to a double resonance enhancement by 2-phonons. In the GO Raman spectrum, the *D peak* is located at  $1357.03 \text{ cm}^{-1}$  due to the out-of-plane vibrations attributed to the presence of structural defects induced by the disruption of  $sp^2$  bonds of the carbon owing to the existence of oxidised functional groups (carboxyl, alcoholic and epoxy groups); the *G band* at  $1595.05 \text{ cm}^{-1}$  is due to the in-plane vibrations of the  $sp^2$  carbon atoms; the *2D band* at  $2688.98 \text{ cm}^{-1}$  is due to the out-of-plane vibrations attributed to the presence of structural defects.

**Figure S50:** Raman spectra of the flake, radiated at  $1601 \text{ cm}^{-1}$ . On the top, Raman spectrum of the deepest point (corresponding to dark red in the red-colour scale) of the selected flake and, on the bottom, Raman spectrum of the highest part (corresponding to white) of the flake.

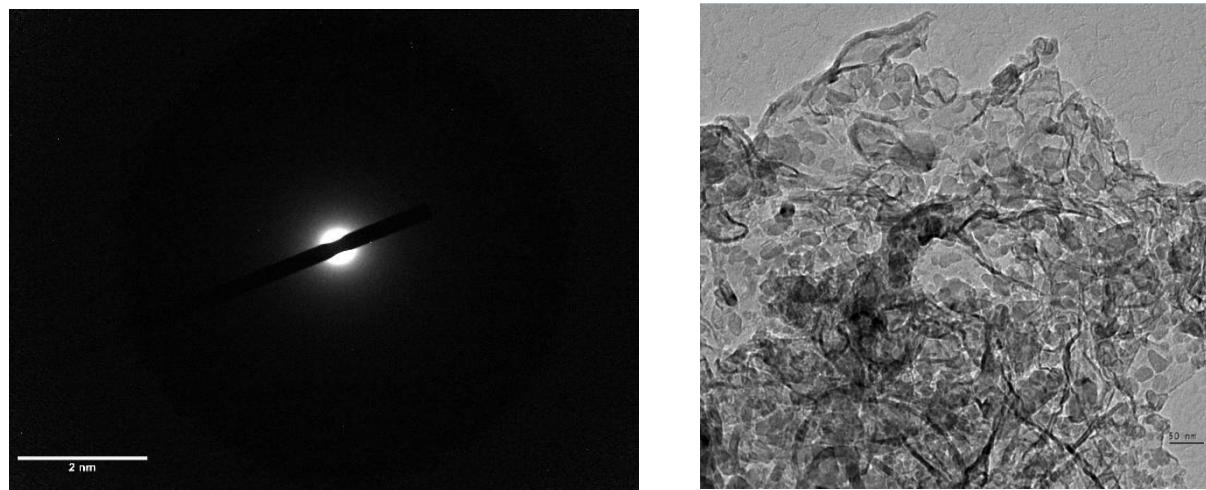

**Figure S51:** Raman spectra of the flake, radiated at 1357 cm<sup>-1</sup>. On the top, Raman spectrum of the deepest point (corresponding to dark blue in the blue-colour scale) of the selected flake and, on the bottom, Raman spectrum of the highest part (corresponding to white) of the flake.

## X-ray Crystallography Details

The selected crystal was mounted onto a goniometer head and cooled to 150K with an Oxford Cryosystem. Intensity data for (CG) (**4**) and (AcGC) (**5**) were collected on a SuperNova, Dual, Cu at zero, EosS2 using a Cu microfocus source ( $\lambda = 1.54184$  Å). Unit cell determination, data collection, data reduction and a symmetry-related (multi-scan) absorption correction were performed using the CrysAlisPro software.<sup>1</sup> The structure of AcGC (CCDC: 2301154, internal data code s15sip4) was solved with SUPERFLIP and that of GC (CCDC: 2301155, internal data code s17sip7) was solved with SHELXT. The structures were then refined by a full-matrix least-squares procedure based on F<sup>2</sup> (Shelxl-2019/2).<sup>2</sup> All non-hydrogen atoms were refined anisotropically. Hydrogen atoms were placed onto calculated positions and refined using a riding model. Additional programmes used for analyzing data and their graphical manipulation included SHELXle<sup>3</sup> and Mercury<sup>4</sup>. The crystal structures data via the joint CCDC/FIZ Karlsruhe deposition service, deposition numbers are 2301154 (AcGC) and 2301155 (GC).

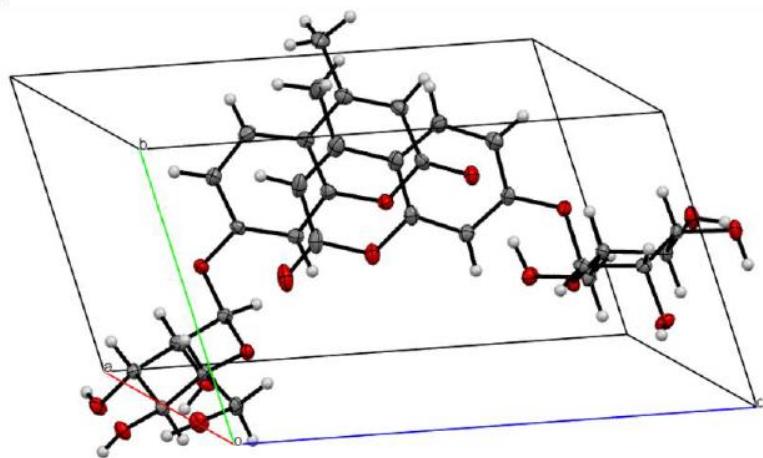

**Figure S60.** (a) Molecular structure of 4-methylumbelliferyl-7-yl-2,3,4,6-tetra-O-acetyl- $\alpha$ -D-mannopyranose (AcGC) (**5**). Only one of the molecules of the asymmetric unit is shown for clarity. (b) 3D X-ray packing showing the unit cell. Thermal ellipsoids at 50% probability.

**Table S8.** Crystal data and structure refinement for CG (4).

Identification code	CG (4)	
Empirical formula	C16 H18 O8	
Formula weight	338.30	
Temperature	150.01(10) K	
Wavelength	1.54184 Å	
Crystal system	Triclinic	
Space group	P1	
Unit cell dimensions	a = 7.9134(3) Å b = 7.9212(4) Å c = 12.5663(6) Å	a= 105.567(4)°. b= 104.160(4)°. g = 91.397(3)°.
Volume	732.32(6) Å <sup>3</sup>	
Z	2	
Density (calculated)	1.534 Mg/m <sup>3</sup>	
Absorption coefficient	1.060 mm <sup>-1</sup>	
F(000)	356	
Crystal size	0.150 x 0.090 x 0.020 mm <sup>3</sup>	
Theta range for data collection	3.782 to 73.044°.	
Index ranges	-9<=h<=8, -9<=k<=9, -15<=l<=13	
Reflections collected	4688	
Independent reflections	3355 [R(int) = 0.0226]	
Completeness to theta = 67.684°	99.8 %	
Absorption correction	Semi-empirical from equivalents	
Max. and min. transmission	1.00000 and 0.82567	
Refinement method	Full-matrix least-squares on F <sup>2</sup>	
Data / restraints / parameters	3355 / 3 / 467	
Goodness-of-fit on F <sup>2</sup>	1.032	
Final R indices [I>2sigma(I)]	R1 = 0.0296, wR2 = 0.0770	
R indices (all data)	R1 = 0.0307, wR2 = 0.0782	
Absolute structure parameter	-0.03(12)	
Extinction coefficient	n/a	
Largest diff. peak and hole	0.220 and -0.193 e.Å <sup>-3</sup>	

**Table S9.** Atomic coordinates ( $\times 10^4$ ) and equivalent isotropic displacement parameters ( $\text{\AA}^2 \times 10^3$ ) for CG (4). U(eq) is defined as one third of the trace of the orthogonalized  $U_{ij}$  tensor.
