## 1. Computational Methods

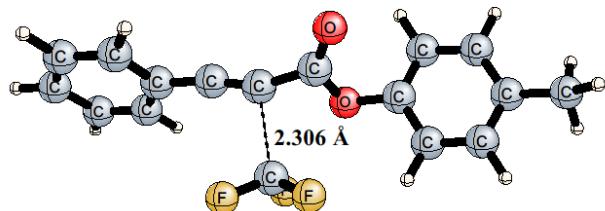

Geometry optimizations and harmonic vibrational frequency computations for the structures considered were carried out with DFT, the M062X hibrit functional.<sup>1</sup> For this purpose, a Pople-type polarized triple- $\zeta$  split-valence basis sets, 6-311G(d,p), was used.<sup>2-4</sup> Single point energies were computed at the optimized geometries with the coupled-cluster singles and doubles with perturbative triples method employing the domain based local pair natural orbitals approach [DLPNO-CCSD(T)].<sup>5,6</sup> In DLPNO-CCSD(T) computations Dunning's correlation consistent triple- $\zeta$  split valence basis set, cc-pVTZ, is employed.<sup>7,8</sup> DFT computations were carried out by using the Gaussian 16 program,<sup>9</sup> while the ORCA package<sup>10,11</sup> (ORCA 4.2.1) is employed for DLPNO-CCSD(T) computations. For the TS between species A and B, the TSA-B notation is used throughout the article.
