1 General Methods

$^1$H NMR and $^{13}$C NMR spectra were recorded on a Bruker 400 MHz spectrometer and chemical shifts are reported in parts per million (δ). Dimethyl sulfone has been used as the internal standard for yield determination by $^1$H NMR analysis of the crude reaction mixtures. The following abbreviations have been used to explain the multiplicities: s = singlet, d = doublet, t = triplet, q = quartet, m = multiplet, quin = quintuplet, sext = sextet, sep = septet, br = broad. FT-IR spectra were recorded on a Perkin-Elmer 681 spectrometer. Analytical thin-layer chromatography (TLC) was carried out on pre-coated 0.25 mm thick plates of Kieselgel 60 F254; visualisation was accomplished by UV light (254 nm) or by spraying a solution of 5% (w/v) ammonium molybdate and 0.2% (w/v) cerium(III) sulfate in 100 mL 17.6% (w/v) aq. sulphuric acid and heating to 473 K until blue spots appeared. Chromatography was conducted by using silica gel 60 with a particle size distribution 40–63 μm and 230–400 ASTM. GC-MS analyses were performed on HP 5995C model. High-resolution mass spectrometry (HRMS) analyses were performed using a Bruker microTOF QII mass spectrometer equipped with an electrospray ion source (ESI). Melting points were determined with an Electrothermal melting point apparatus. Reagents and solvents, unless otherwise specified, were purchased from Sigma-Aldrich (Sigma-Aldrich, St. Louis, MO, USA) and TCI (Tokyo Chemical Industry, Europe, N. V.) and used without any further purification. Petroleum ether refers to the 40–60 °C boiling fraction. Deep Eutectic Solvents (DES) [MePh$_3$PBr (MTPBr)/ethylene glycol (EG) (1:5 mol/mol); MTPBr/glycerol (gly) (1:4 mol/mol); cholinium chloride (ChCl)/EG (1:2 mol/mol); tetrabutylammonium bromide (TBAB)/EG (1:4 mol/mol)] were prepared by heating under stirring at 60–80 °C for 10–30 min the corresponding individual components until a clear eutectic mixture was obtained. Full characterization data, including copies of $^1$H NMR and $^{13}$C NMR spectra, have been reported for all the synthesized compounds.

$^a$Reaction conditions: iodobenzene 1a (1.0 mmol), Pd(OAc)$_2$ (0.5 mol%), Mo(CO)$_6$ (0.1-0.7 mmol), MTPBr/EG (2.0 mL), 80 °C, 2 h. $^b$Calculated via $^1$H NMR analysis of the crude reaction mixture using the internal standard technique (NMR internal standard: dimethyl sulfone).
**5 Experimental Procedure for the Alkoxycarbonylation Reaction of (Hetero)Aryl Iodide 1a-t in MTPBr/EG or MTPBr/gly Eutectic Mixture**

In a 10 mL round bottom flask, (hetero)aryl iodide (1a-r, 0.5 mmol), Mo(CO)$_6$ (66.0 mg, 0.25 mmol), NaOAc·3H$_2$O (204.0 mg, 1.5 mmol), Pd(OAc)$_2$ (trimeric, FW = 673.46, 0.5 mol%, 0.0025 mmol, 1.6 mg) and MTPBr/EG or MTPBr/gly DES (1.0 mL) were sequentially added. The reaction was stirred for 2 hours at 80 °C. After this time, the reaction mixture was cooled to room temperature and water (2.5 ml) and HCl solution (10% v/v) up to pH = 2 were sequentially added. The mixture was then extracted with AcOEt (5 ml x 3) and the reunited organic phases were washed with brine, dried over anhydrous Na$_2$SO$_4$, filtered through a celite pad and evaporated under reduced pressure. The crude was purified by flash column chromatography on silica gel (using as eluent petroleum ether/AcOEt 80/20 to pure AcOEt), obtaining the desired 2-hydroxyethyl esters as pure compounds 2a-r or the desired glycerol esters as mixture of isomers (2u-w, 2u’-w’).

When the diiodo arenes 1s-t were used as the substrates, the following procedure was employed: in a 10 mL round bottom flask, diiodo arene (1s-t, 0.5 mmol), Mo(CO)$_6$ (132.0 mg, 0.5 mmol), NaOAc·3H$_2$O (408.0 mg, 3.0 mmol), Pd(OAc)$_2$ (trimeric, FW = 673.46, 1.0 mol%, 0.005 mmol, 3.12 mg) and MTPBr/EG DES (2.0 mL). The reaction was stirred for 2 hours at 80 °C. The work-up procedure and purification process are similar to those ones described above for the substrates 1a-r.
