General experimental information

Unless otherwise noted, all reactions were performed under an atmosphere of dry nitrogen in oven-dried (100 °C) glassware. Commercially available starting materials and reagents were used as received unless otherwise noted. All the solvents used were dried by passage through a column of activated alumina under nitrogen using an LC Technology solvent purification system. Thin-layer chromatography (TLC) was performed using F254 0.2 mm silica plates, followed by visualisation with UV irradiation at 254 nm, and staining with ethanolic vanillin or potassium permanganate solution. Flash column chromatography was performed using 63–100 μm silica gel. Melting points were recorded on an Electrothermal melting point apparatus and are uncorrected. Infrared (IR) spectra were recorded with an FT-IR spectrometer using a diamond ATR sampling accessory. NMR spectra were recorded at ambient temperature in CDCl₃/TMS, (CD₃)₂CO or (CD₃)₂SO solutions using a spectrometer operating at 400 MHz for ¹H nuclei, 100 MHz for ¹³C nuclei and 376 MHz for ¹⁹F nuclei. All chemical shifts are reported in ppm on the δ scale and were measured relative to the tetramethylsilane peak recorded as δ 0.00 in CDCl₃/TMS, the residual (CD₃)₂CO (δ 2.05) peak, or the residual (CD₃)₂SO (δ 2.50) peak. Coupling constants, $J$, are reported in Hertz [Hz] where applicable. Multiplicities are reported as "s" (singlet), "d" (doublet), "t" (triplet), "q" (quartet), "p" (pentet), "m" (multiplet), "br" (broad or combination thereof). Where distinguishable from those due to a major isomer/diastereomer or rotamer, resonances due to the minor isomer, diastereomer and rotamer are denoted by an asterisk (*). High-resolution mass spectra were recorded on a microTOF QII (electrospray ionisation, ESI) mass spectrometer.
General electrochemical experimental information

With no precautions to exclude air or moisture, the ElectraSyn vial (5 mL) with a stirrer bar was charged with KBr (1-2 eq.) and a mixture of MeCN-water (5:1, 3 mL). The ElectraSyn vial cap equipped with an anode (glassy carbon) and cathode (glassy carbon) were inserted into the mixture (Figure S1). The reaction mixture was electrolysed with stirring at a constant current of 2.5 mA for 2 min, after this, the reaction was stopped and the indole (0.23 mmol) was added. The vial cap was replaced, and the mixture electrolysed at 2.5 mA until 2 F/mol had been consumed. Upon completion, the ElectraSyn vial cap was removed, and the electrodes rinsed with EtOAc and water. The resulting mixture was diluted with EtOAc (10 mL) and sodium thiosulfate (sat. sol. 10 mL) was added. The aqueous layer was extracted with EtOAc (3 x 10 mL). The organic extracts were combined, dried (Na$_2$SO$_4$), filtered and concentrated under reduced pressure. The crude oxindole was purified by flash chromatography on silica gel eluting with EtOAc-light petroleum to give the desired oxindole.

Figure S1, IKA ElectraSyn 2.0 and a 5 mL ElectraSyn undivided vial (left) fitted with ElectraSyn glassy carbon electrodes (4 x 0.8 x 0.2 cm; 4.0 cm$^2$ area exposed to the electrolyte; right) were used unless otherwise stated.

Procedures for cyclic voltammetry

Experiment 1: Determination of oxidation potential of 8a using a three-electrode cell

Cyclic voltammetry experiments were conducted with a CH660 potentiostat, with a three-electrode cell (Figure S3). The redox behaviour of the reaction mixture [3-methylindole (8a, blue line), KBr (green line) and a mixture of KBr and 3-methylindole (8a, dotted black line)] was studied in MeCN-H2O (5:1) containing LiClO4 (0.1 M) as the supporting electrolyte at room temperature. The electrochemical cell was made up of a BASi platinum wire auxiliary electrode (7.5 cm), a BASi glassy carbon working electrode (q 3.0 mm) and a BASi Ag/AgCl (3 M NaCl) reference electrode (Figure S2). The substrate concentration was 1 mM, and the potential was scanned from -0.25 V to 1.9 V with a scan rate of 0.1 Vs⁻¹. All experiments were done in triplicate.
Experiment 2: Determination of reduction potential of 8a using a three-electrode cell

Cyclic voltammetry experiments were conducted with a CH660 potentiostat, with a three-electrode cell (Figure S3). The redox behaviour of the reaction mixture [3-methylindole (8a, blue line), KBr (green line) and a mixture of KBr and 3-methylindole (8a, dotted black line)] was studied in MeCN-H$_2$O (5:1) containing LiClO$_4$ (0.1 M) as the supporting electrolyte at room temperature. The electrochemical cell was made up of a BASi platinum wire auxiliary electrode (7.5 cm), a BASi glassy carbon working electrode (⌀ 3.0 mm) and a BASi Ag/AgCl (3 M NaCl) reference electrode (Figure S2). The substrate concentration was 1 mM, and the potential was scanned from 0.25 V to -2.0 V with a scan rate of 0.1 Vs$^{-1}$. All experiments were done in triplicate.

Experiment 3: Determination of oxidation potential of 8a using a two-electrode cell

Cyclic voltammetry experiments were conducted with a CH660 potentiostat, with a two-electrode cell (Figure S4). The redox behaviour of the reaction mixture [3-methylindole (8a, blue line), KBr (green line) and a mixture of KBr and 3-methylindole (8a, dotted black line)]
was studied in MeCN-H$_2$O (5:1) containing LiClO$_4$ (0.1 M) as the supporting electrolyte at room temperature. The electrochemical cell was made up of BASi glassy carbon electrodes (⌀ 3.0 mm) used as working and counter/reference electrodes (Figure S2). The substrate concentration was 1 mM, and the potential was scanned from -0.25 V to 3.0 V with a scan rate of 0.1 V s$^{-1}$. All experiments were done in triplicate.

**Active brominating species investigation**

To a stirring solution of 3-methylindole (8a, 30 mg, 0.23 mmol) in MeCN-H$_2$O (5:1, 3 mL) was added dropwise elemental bromine (1 eq.). The reaction mixture was stirred at rt for 5 minutes. Then, sodium thiosulfate (sat. sol., 10 mL) was added and the mixture was extracted with EtOAc (3 x 20 mL). The organic extracts were combined, dried (Na$_2$SO$_4$) and concentrated under reduced pressure. Purification by flash chromatography on silica gel (40% EtOAc in light petroleum) gave 3-methylindolin-2-one as a pale-yellow powder (9a, 22 mg, 0.15 mmol, 65%). NMR Spectroscopic data as previously reported.

With no precautions to exclude air or moisture, the ElectraSyn vial (5 mL) with a stirrer bar was charged KBr (1 eq., 27 mg), 3-methylindole (8a, 30 mg, 0.23 mmol) and a mixture of MeCN-H$_2$O-AcOH (15:2.4:2, 3 mL). The ElectraSyn vial cap equipped with an anode (glassy carbon) and cathode (glassy carbon) were inserted into the mixture. The reaction mixture was electrolysed with stirring at a constant current of 2.5 mA until 2 F/mol had been consumed. Upon completion, the ElectraSyn vial cap was removed, and the electrodes rinsed with EtOAc and water. The resulting mixture was diluted with EtOAc (10 mL) and sodium thiosulfate (sat. sol. 10 mL) was added. The aqueous layer was extracted with EtOAc (3 x 10 mL). The organic extracts were combined, dried (Na$_2$SO$_4$), filtered and concentrated under reduced pressure. Purification by flash chromatography on silica gel (40% EtOAc in light petroleum) gave 3-
methylindolin-2-one as a pale-yellow solid (19 mg, 0.14 mmol, 56%). NMR Spectroscopic data as previously reported.

With no precautions to exclude air or moisture, the ElectraSyn vial (5 mL) with a stirrer bar was charged KBr (1 eq., 27 mg), tert-butyl 1,3,4,9-tetrahydro-pyrido[3,4-b]indole-2-carboxylate26 (11, 63 mg, 0.23 mmol) and a mixture of MeCN-H2O (5:1, 3 mL). The ElectraSyn vial cap equipped with an anode (glassy carbon) and cathode (glassy carbon) were inserted into the mixture. The reaction mixture was electrolysed with stirring at a constant current of 2.5 mA until 2 F/mol had been consumed. Upon completion, the ElectraSyn vial cap was removed, and the electrodes rinsed with EtOAc and water. The resulting mixture was diluted with EtOAc (10 mL) and sodium thiosulfate (sat. sol. 10 mL) was added. The aqueous layer was extracted with EtOAc (3 x 10 mL). The organic extracts were combined, dried (Na2SO4), filtered and concentrated under reduced pressure. Purification by flash chromatography on silica gel (30% EtOAc in light petroleum) gave the tert-Butyl 2-oxospiro[indoline-3,3'-pyrrolidine]-1'-carboxylate as a pale-yellow oil (12, 12 mg, 0.04 mmol, 18%); mixture of two rotational isomers (~1:0.7). Purification by flash chromatography on silica gel (40\% EtOAc in light petroleum) gave tert-butyl 2-oxospiro[indoline-3,3'-pyrrolidine]-1'-carboxylate as a pale-yellow oil (12, 53 mg, 0.18 mmol, 80\%). NMR Spectroscopic data as previously reported.

With no precautions to exclude air or moisture, each of the compartments of the IKA Pro-Divide with a stirrer bar were charged with KBr (1 eq., 27 mg) and a mixture of MeCN-H\textsubscript{2}O (5:1, 3 mL). The cell was equipped with an anode (glassy carbon) and cathode (glassy carbon). The reaction mixture was electrolysed with stirring at a constant current of 2.5 mA for 2 min, after this, the reaction was stopped and 3-methylindole (8\textsubscript{a}, 30 mg, 0.23 mmol) was added. The vial cap was replaced, and the mixture electrolysed at 2.5 mA until 2 F/mol had been consumed.
Upon completion, the ElectraSyn vial cap was removed, and the electrodes rinsed with EtOAc and water. The resulting mixture was diluted with EtOAc (10 mL) and sodium thiosulfate (sat. sol. 10 mL) was added. The aqueous layer was extracted with EtOAc (3 x 10 mL). A current of 3.8 mA was used to maintain the reaction conditions identical to that of the smaller scale reaction (4 x 0.8 x 0.2 cm; 6.1 cm² area exposed to the electrolyte; 0.625 mA cm⁻²).

With no precautions to exclude air or moisture, the ElectraSyn vial (20 mL) with a stirrer bar was charged with KBr (2 eq., 357 mg, 3.0 mmol) and a mixture of MeCN-H₂O (5:1, 20 mL). The ElectraSyn vial cap equipped with an anode (glassy carbon) and cathode (glassy carbon) were inserted into the mixture (**Figure S8**). The reaction mixture was electrolysed with stirring at a constant current of 3.8 mA for 2 min, after this, the reaction was stopped and the 3-methylindole (8a, 198 mg, 1.5 mmol) was added. The vial cap was replaced, and the mixture electrolysed at 3.8 mA until 2 F/mol had been consumed. Upon completion, the ElectraSyn vial cap was removed, and the electrodes rinsed with EtOAc and water. The resulting mixture was diluted with EtOAc (25 mL) and sodium thiosulfate (sat. sol. 25 mL) was added. The aqueous layer was extracted with EtOAc (3 x 20 mL). The organic extracts were combined, dried (Na₂SO₄), filtered and concentrated under reduced pressure. Purification by flash chromatography on silica gel (40% EtOAc in light petroleum) gave 3-methylindolin-2-one as a pale-yellow solid (9a, 145 mg, 0.99 mmol, 66%). NMR Spectroscopic data as previously reported.

**3-Bromoindole (14)**

![Chemical structure of 3-Bromoindole](image)

Prepared according to the general electrochemical procedure from indole (8aa, 27 mg, 0.23 mmol) and KBr (2 eq.). Purification by flash chromatography on silica gel (10% EtOAc in light petroleum) gave the *title compound* as a colourless solid (18 mg, 0.09 mmol, 40%). **H NMR** (400 MHz, CDCl₃) δ 8.12 (br s, 1 H, NH), 7.58 (d, J 7.7, 1 H, ArH), 7.34 (d, J 7.5, 1 H, ArH), 7.27-7.17 (m, 3 H, ArH). NMR Spectroscopic data in accordance with previous reports.²⁹
