1. General Information

Nuclear magnetic resonance (NMR) spectra were recorded in CDCl_3 and $\text{DMSO}-d_6$ on Bruker 600, 700 MHz, or JEOL 600 NMR instrument (at 600 or 700 MHz for ^1H , and at 150, or 175 MHz for ^{13}C). Proton chemical shifts were reported in parts per million (δ scale). The ^1H NMR chemical shifts were reported in ppm with the residual non-deuterated solvents: CDCl_3 at 7.26 ppm as standard. The ^{13}C NMR chemical shifts were given using CDCl_3 as the internal standard (CDCl_3 : $\delta = 77.2$ ppm and $\text{DMSO}-d_6$: $\delta = 39.5$ ppm). High-resolution mass spectra (HRMS) were obtained using Agilent P/N G1969-90010. High-resolution mass spectra were reported for the molecular ion $[\text{M}+\text{Na}]^+$ or $[\text{M}+\text{H}]^+$. X-ray diffraction experiment was carried out on an Agilent Gemini and the data obtained was deposited at the Cambridge Crystallographic Data Centre. Column chromatography was performed on silica gel (200-300 mesh) using an eluent of ethyl acetate (EA) and petroleum ether (PE). All reagents and solvents were obtained from commercial sources and used without further purification. Oil baths were used as the heat source. 1-benzyl-4-(pyrrolidin-1-yl)indoline-2,3-dione¹ were prepared according to the literature procedures.

2. Synthesis of Compound 3

A mixture of C-4 pyrrolidine substituted isatins **1** (0.1 mmol), pyrazolone substrates **2** (0.15 mmol), $\text{Sc}(\text{OTf})_3$ (10 mol%), 5 \AA MS (50 mg) and MeCN (1.0 mL) was stirred at 80°C and monitored by TLC. After reactions completed, the residue was purified by silica gel flash column chromatography (petroleum ether/ethyl acetate) to afford the compound **3** as brown solids.

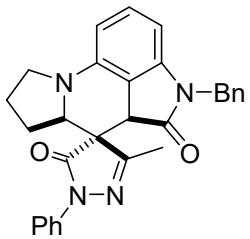

3. Gram-scale Synthesis of Compound 3a

To a Schlenk tube were added 1-benzyl-4-(pyrrolidin-1-yl)indoline-2,3-dione **1a** (4 mmol, 1.23 g), pyrazolone substrate **2a** (6 mmol, 1.05 g), Sc(OTf)_3 (10 mol%), 5 Å MS (500 mg) and MeCN (10 mL) was stirred at 80 °C for overnight. The reaction was monitored by TLC. After completion of the reaction, the reaction mixture was concentrated and directly purified by flash column chromatography on silica gel (PE/EA = 20:1 to 15:1 v/v) to afford the pure products **3a** as a brown solid in 88% yield (1.63 g).

5. X-ray Crystal Structures of 3a

To a 10 mL tube containing **3a** (50.0 mg) was added a mixture of solvent (PE:EA = 5:1) (6.0 mL). A clear solution was obtained through ultrasound treatment and was kept at room temperature and the crystals were obtained after the solvent evaporated, which were characterized by X-ray single crystal diffraction. X-ray diffraction experiment was carried out on an Agilent Gemini and the data obtained were deposited at the Cambridge Crystallographic Data Centre.
