## 4. UV-vis and fluorescence titration studies

## UV-vis spectral studies:

A stock solution of PCF1 $\times 10^{-5} \mathrm{M}$ was prepared in water-acetonitrile ( $2: 1, \mathrm{v} / \mathrm{v}$ ). Aspartic acid solution of concentration $1 \times 10^{-4} \mathrm{M}$ was prepared in Millipore water. All experiments were carried out in an aqueous medium at $\mathrm{pH} 6.5-6.8$. During the titration, each time a $1 \times 10^{-5} \mathrm{M}$ solution of PCF was filled in a quartz optical cell of 1 cm optical path length and Aspartic acid stock solution was added into the quartz optical cell gradually by using a micropipette.

## Fluorescence spectral studies:

A stock solution of PCF $1 \times 10^{-5} \mathrm{M}$ was prepared in water-acetonitrile ( $2: 1, \mathrm{v} / \mathrm{v}$ ). Aspartic acid solution of concentration $1 \times 10^{-4} \mathrm{M}$ was prepared in Millipore water. All experiments were carried out in aqueous medium at pH 6.5-6.8. During titration, each time a $1 \times 10^{-5} \mathrm{M}$ solution of PCF was filled in a quartz optical cell of 1 cm optical path length and Aspartic acid stock solution was added into the quartz optical cell gradually by using a micropipette. For all fluorescence measurements, excitations were provided at 300 nm , and emissions were collected from 390 to 550 nm .

## 5. Evaluation of the association constants for the formation of PCF-Aspartic acid complex:

## By Fluorescence Method:

Binding constant of the chemosensor PCF was calculated through emission method by using the following equation:

$$
\begin{equation*}
1 /\left(\mathrm{I}-\mathrm{I}_{0}\right)=1 / \mathrm{K}\left(\mathrm{I}_{\max }-\mathrm{I}_{0}\right)[\mathrm{G}]+1 /\left(\mathrm{I}_{\max }-\mathrm{I}_{0}\right) \tag{ii}
\end{equation*}
$$

Where $\mathrm{I}_{0}, \mathrm{I}_{\text {max }}$, and I represent the emission intensity of free PCF, the maximum emission intensity observed in the presence of added Aspartic acidat $434 \mathrm{~nm}\left(\lambda_{\text {ex }}=300 \mathrm{~nm}\right.$ ), [G] is the concentration of the guestAspartic acid and the emission intensity at a certain concentration of the Aspartic acid, respectively. $[\mathrm{H}]$ is the concentration of the host PCF.

## Binding constant calculation graph (Fluorescence method):

Fig. S5. Linear regression analysis ( $1 /[\mathrm{G}]$ vs $1 / \Delta \mathrm{I}$ ) for the calculation of association constant value by fluorescence titration method.

The association const. ( $\mathrm{K}_{\mathrm{a}}$ ) of PCF for sensing Aspartic acidwas determined from the equation: $\mathrm{K}_{\mathrm{a}}=$ intercept/slope. From the linear fit graph, we get intercept $=0.24652$, slope $=3.20063 \times 10^{-6}$. Thus, we get, $\mathrm{K}_{\mathrm{a}}=0.24652 /\left(3.20063 \times 10^{-6}\right)=7.7 \times 10^{4} \mathrm{M}^{-1}$.

## 6. Job's plot

Figure S6. Job's plot of $\mathbf{P C F}(10 \mu \mathrm{M})$ with Aspartic acid in acetonitrile-water (1:2, v/v), at neutral pH , by fluorescence method, which indicate 1:1 stoichiometry for PCF with Aspartic acid. Standard deviations are represented by error bar ( $\mathrm{n}=3$ ).

## 7. Calculation of limit of detection (LOD) of PCF with Aspartic acid:

The detection limit of the chemosensor PCF for Aspartic acid was calculated on the basis of fluorescence titration. To determine the standard deviation for the fluorescence intensity, the emission intensity of four individual receptors without Aspartic acid was measured by 10 times and the standard deviation of blank measurements was calculated.
The limit of detection (LOD) of PCF for sensing Aspartic acid was determined from the following equation ${ }^{2-3}$ :

$$
\mathrm{LOD}=\mathrm{K} \times \mathrm{SD} / \mathrm{S}
$$

Where $\mathrm{K}=2$ or 3 (we take 3 in this case); SD is the standard deviation of the blank receptor solution; $S$ is the slope of the calibration curve.

Figure S7. Linear fit curve of PCFat434 nm with respect to Aspartic acid concentration
For PCF with Aspartic acid:
From the linear fit graph, we get slope $=8.56635 \times 10^{7}$, and SD value is 1.3189665 .
Thus, using the above formula, we get the Limit of Detection $=4.61 \times 10^{-8} \mathrm{M}$. Therefore, PCF can detect Aspartic acid up to this very lower concentration by fluorescence technique.

## 8. Time-dependent fluorescence spectra of PCF in the presence of Aspartic acid

Figure S8. Time-dependent fluorescence spectra of PCF in the presence of Aspartic acid.

## 9. PCF lifetime in presence and absence of aspartic acid

Figure S9. PCF lifetime in presence and absence of aspartic acid

Table S2. Decay time components of PCF and PCF + Asp

| System | $\mathbf{b}_{1}$ | $\boldsymbol{\tau}_{1}$ | $\mathbf{b}_{\mathbf{2}}$ | $\boldsymbol{\tau}_{\mathbf{2}}$ | $\langle\boldsymbol{\tau}\rangle=\mathbf{b}_{1} \tau_{1}+\mathbf{b}_{2} \boldsymbol{\tau}_{2}$ |
| :--- | :--- | :--- | :--- | :--- | :--- |
| PCF | 0.430738 | $5.42 \mathrm{E}-01$ | 0.029351 | $1.75 \mathrm{E}+00$ | 0.28 ns |
| PCF + Asp | 0.280081 | $1.45 \mathrm{E}-01$ | 0.449727 | $5.48 \mathrm{E}+00$ | 2.50 ns |

## 10. Reversibility analysis of PCF

Figure S10. Reversibility analysis of $\operatorname{PCF}\left(10^{-5} \mathrm{M}\right)$ with Aspartic acid $\left(10^{-4} \mathrm{M}\right)$ in presence of $\mathrm{Cu}^{2+}\left(10^{-4} \mathrm{M}\right)$.

## 11. pH titration study:

Figure S11. Effect of pH on the fluorescence intensity of $\mathbf{P C F}\left(10^{-5} \mathrm{M}\right)$ in the absence of Aspartic acid (red line) and in the presence of Aspartic acid ( $10^{-4} \mathrm{M}$, black line).

## 12. DFT study

Table S3. Details of the geometry optimization in Gaussian 09 program

| Details | PCF | Aspartic acid | PCF 1 |
| :--- | :---: | :---: | :---: |
| Calculation method | B3LYP | B3LYP | B3LYP |
| Basis set | $6-31 \mathrm{G}(\mathrm{d}, \mathrm{p})$ | $6-31 \mathrm{G} \mathrm{(d,p)}$ | $6-31 \mathrm{G}(\mathrm{d}, \mathrm{p})$ |
| E(CAM-B3LYP) (a.u.) | -936.66 | -512.32 | -1449.00 |
| Charge, Multiplicity | 0,1 | 0,1 | 0,1 |

## TDDFT- Calculations

Table S4. Selected electronic excitation energies (eV), oscillator strengths (f), main configurations of the low-lying excited states of PCF. The data were calculated by TDDFT//B3LYP/6-31G(d,p) based on the optimized ground state geometries.

| Molecules | Electronic <br> Transition | Excitation <br> Energy $^{\mathrm{a}}$ | $\mathrm{f}^{\mathrm{b}}$ | $\operatorname{Composition}^{\mathrm{c}}(\%)$ |
| :---: | :---: | :---: | :---: | :---: |
| PCF | $\mathrm{S}_{0} \rightarrow \mathrm{~S}_{1}$ | 3.2237 eV 384.60 nm | 0.5287 | $\mathrm{H} \rightarrow \mathrm{L}(69.1 \%)$ |
| PCF 1 | $\mathrm{S}_{0} \rightarrow \mathrm{~S}_{1}$ | 3.0716 eV 403 nm | 0.4055 | $\mathrm{H} \rightarrow \mathrm{L}(70 \%)$ |

${ }^{\text {a }}$ Only selected excited states were considered. The numbers in parentheses are the excitation energy in wavelength. ${ }^{\mathrm{b}}$ Oscillator strength. ${ }^{\mathrm{c}} \mathrm{H}$ stands for HOMO and L stands for LUMO.

Table S5. Energies of the highest occupied molecular orbital (HOMO) and lowest unoccupied molecular orbital (LUMO)

| Species | Eномо <br> (a.u.) | ELuмо <br> (a.u.) | $\Delta \mathbf{E ( a . u . )}$ | $\Delta \mathbf{E ( e V )}$ | $\Delta \mathbf{E}(\mathbf{k c a l} / \mathbf{m o l})$ |
| :---: | :---: | :---: | :---: | :---: | :---: |
| PCF | -0.19252 | -0.05946 | 0.14459 | 3.22 | 74.25 |
| PCF 1 | -0.20149 | -0.07434 | 0.14563 | 3.07 | 70.80 |

## 13. Cytotoxicity assay

Figure S12. MTT assay is to determine the cytotoxic effect of PCF at 500 nM concentration on MCF-7 cells. Untreated control cells and Mitomycin-C treated cells are kept as negative and positive control respectively.
