References
Materials and Methods

Materials

All reagents were purchased from Sigma-Aldrich unless otherwise stated. All chemicals were used as received without further purification unless otherwise stated. Solvents for chromatography were purchased from Fisher-Scientific. Deuterated solvents and 3,5-dihydroxybenzyl alcohol were purchased from ACROS Organics. 4-Bromo-4’-tert-butylbiphenyl was purchased from TCI chemicals. p-Toluenesulfonyl chloride was purchased from Alfa Aesar. Iron(II) bistriflimide\(^1\) and 2,6-bisbenzimidazolylpyridine ligands\(^2\) were prepared following literature procedures. Tetrahydrofuran (THF) was dried over sodium and benzophenone. Dichloromethane was distilled over calcium hydride before use. Dimethylformamide (DMF) was dried with activated molecular sieves before use. Thin layer chromatography plates (1000 micron) were purchased from Analtech.

Instrumentation

Matrix Assisted Laser Desorption/Ionization Mass Spectrometry (MALDI-MS). MALDI-TOF was measured by a Bruker Ultraflextreme MALDI-TOF-TOF spectrometer in linear (or reflectance) mode using dithranol as matrix and sodium trifluoroacetate or silver trifluoroacetate as ionizer (or no ionizer).

Nuclear Magnetic Resonance Spectroscopy (NMR). Room Temperature Nuclear Magnetic Resonance Spectroscopy was performed using a Bruker Ascend Avance III 500 MHz spectrometer, a Bruker Avance II+ 500 MHz spectrometer, or a Bruker DRX 400 MHz spectrometer at the University of Chicago NMR facilities. \(^1\)H NMR spectra were referenced to the residual protonated solvent signal and \(^13\)C{\(^1\)H} NMR spectra were referenced to the deuterated solvent carbon resonance signal.

NMR Slippage Kinetic Experiments. Kinetic experiments were performed in Shigemi Tubes purchased from Wilmad-Labglass in CDCl\(_3\) (1mM) using a Bruker AVANCE III HD 500 MHz spectrometer at the NMR facilities at the University of Chicago.

Gel Permeation Chromatography (GPC). GPC measurements were performed utilizing the Soft Matter Characterization Facility at the University of Chicago. Measurements were conducted at 25°C using 3:1 THF:DMF as eluent (flow rate = 1 mL/min), using a Shimadzu autosampler, Shimadzu HPLC LC20-AD pump, 2 Agilent PL.gel 5 um MIXED-D + guard SEC columns, and a Wyatt Optilab T-rEX differential refractive index detector.
Synthesis of Macrocycle Components

Macrocycle Components (140-48)

Figure S1. Synthesis of 148.

A 2-necked 1 L RBF was charged with 9 (1.5 g, 2.94 mmol), Cs₂CO₃ (3.82 g, 11.8 mmol) and DMF (620mL) under an Ar atmosphere. The mixture was heated to 75 °C and stirred while a DMF (310 mL) solution of 3,6-bis(bromomethyl)-9,9-dimethyl-9H-xanthene (1.16g, 2.94 mmol) was added dropwise (at an approximate rate of one drop every 10 s) over 3 d. When all the solution was added the reaction was stirred for a further 24 h at 75 °C. After this time (total reaction time 4 d) the reaction mixture was cooled to RT and the solvent was removed under reduced pressure. The residue was washed in hot CHCl₃ (4 × 100 mL) and the insoluble material (salts) was removed by filtration. The filtrate was collected and the solvent removed under reduced pressure. The resulting material was purified using column chromatography (TEA treated silica gel, chloroform/methanol gradient as eluent) followed by recrystallization (chloroform/methanol mixture) to yield white crystals of 148 in 21% yield (0.435g). ¹H NMR (500 MHz, CDCl₃) δ 8.15 (d, J = 7.9 Hz, 4H, B), 7.87 (t, J = 7.9 Hz, 2H, A), 7.35 (d, J = 8.0 Hz, 4H, H), 7.25-7.21 (m, 8H, C+I), 7.11 (d, J = 8.1 Hz, 4H, D), 7.06 (s, 4H, G), 7.00 (dd, J = 8.9, 2.3 Hz, 4H, E), 5.24 (s, 8H, F), 4.54 (t, J = 7.5 Hz, 8H, K), 1.62 (m, 8H, L), 1.58 (s, 12H, J), 1.00 (m, 24H, M+N+O), 0.54 (m, 12H, P). ¹³C NMR (126 MHz, CDCl₃) δ 155.07, 150.55, 150.31, 150.06, 143.47, 137.86, 137.47, 131.24, 129.28, 126.60, 125.16, 121.39, 114.81, 114.77, 110.74, 104.42, 70.00, 44.95, 33.90, 32.61, 31.19, 30.10, 26.36, 22.42, 13.82. MALDI-MS: 1599.6 ([M]+Ag⁺).

Figure S2. Synthesis of 144.
A 2-necked 1 L RBF was charged with 9 (1.0 g, 1.95 mmol), Cs₂CO₃ (2.6 g, 7.8 mmol) and DMF (440 mL) under an Ar atmosphere. The mixture was heated to 75 °C and stirred while a DMF (220 mL) solution of 2,7-bis(bromomethyl)naphthalene (0.61 g, 1.95 mmol) was added dropwise (at an approximate rate of one drop every 10 s) over 3 d. When all the solution was added the reaction was stirred for a further 24 h at 75 °C. After this time (total reaction time 4 d) the reaction mixture was cooled to RT and the solvent was removed under reduced pressure. The residue was washed in hot CHCl₃ (4 × 100 mL) and the insoluble material (salts) was removed by filtration. The filtrate was collected and the solvent removed under reduced pressure. The resulting material was purified using column chromatography (TEA treated silica gel, chloroform/methanol gradient as eluent) followed by recrystallization (chloroform/methanol mixture) to yield white crystals of 1 in 20% yield (0.255 g). ¹H NMR (400 MHz, CDCl₃) δ 8.10 (d, J = 7.9 Hz, 4H, B), 7.81-7.75 (m, 10H, A+C+I), 7.53 (d, J = 8.0 Hz, 4H, H), 7.24 (s, 4H, G), 7.19 (d, J = 8.9 Hz, 4H, D), 7.01 (dd, J = 8.9, 2.3 Hz, 4H, E), 5.42 (s, 8H, F), 4.48 (t, J = 7.5 Hz, 8H, H), 1.55 (m, 8H, K), 0.89 (m, 24H, L+M+N), 0.49 (m, 12H, O).

Figure S3. Synthesis of 1.

1 L RBF was charged with 9 (1.0 g, 1.95 mmol), Cs₂CO₃ (2.6 g, 7.8 mmol) and DMF (440 mL) under an Ar atmosphere. The mixture was heated to 75 °C and stirred while a DMF (220 mL) solution of α,α′-Dibromo-p-xylene (0.51 g, 1.95 mmol) was added dropwise (at an approximate rate of one drop every 10 s) over 3 d. When all the solution was added the reaction was stirred for a further 24 h at 75 °C. After this time (total reaction time 4 d) the reaction mixture was cooled to RT and the solvent was removed under reduced pressure. The residue was washed in hot CHCl₃ (4 × 100 mL) and the insoluble material (salts) was removed by filtration. The filtrate was collected and the solvent removed under reduced pressure. The resulting material was purified using column chromatography (TEA treated silica gel, chloroform/methanol gradient as eluent) followed by recrystallization (chloroform/methanol mixture) to yield white crystals of 1 in 11% yield (0.133 g). ¹H NMR (400 MHz, CDCl₃) δ 8.19 (d, J = 7.9 Hz, 4H, B), 7.90 (t, J = 7.9 Hz, 2H, A), 7.37 (s, 8H, G), 7.21-7.15 (m, 8H, C+D), 6.93 (dd, J = 8.8, 2.4 Hz, 4H, E), 5.30 (s, 8H, F), 4.48 (t, J = 7.5 Hz, 8H, H), 1.55 (m, 8H, I), 0.89 (m, 24H, J+K+L), 0.49 (m, 12H, M). ¹³C NMR (101 MHz, CDCl₃) δ 154.6, 150.1, 150.0, 143.39, 137.8, 137.2, 131.2, 126.9, 125.1, 114.7, 110.69, 104.77, 70.0, 44.86, 31.1, 26.3, 22.4, 13.7. Figure S4. Synthesis of 1₄₀.

1 L RBF was charged with 9 (1.0 g, 1.95 mmol), Cs₂CO₃ (2.6 g, 7.8 mmol) and DMF (440 mL) under an Ar atmosphere. The mixture was heated to 75 °C and stirred while a DMF (220 mL) solution of α,α′-Dibromo-m-xylene (0.51 g, 1.95 mmol) was added dropwise (at an approximate rate of one drop every 10 s) over 3 d. When all the solution was added the reaction was stirred for a further 24 h at 75 °C. After this time (total reaction time 4 d) the reaction mixture was cooled to RT and the solvent was removed under reduced pressure. The residue was washed in hot CHCl₃ (4 × 100 mL) and the insoluble material (salts) was removed by filtration. The filtrate was collected and the solvent removed under reduced pressure. The resulting material was purified using column chromatography (TEA treated silica gel, chloroform/methanol gradient as eluent) followed by recrystallization (chloroform/methanol mixture) to yield white crystals of 1₄₀ in 7% yield (0.085 g). ¹H NMR (500 MHz, CDCl₃) δ 8.19 (d, J = 7.9 Hz, 4H, B), 7.92 (t, J = 7.9 Hz, 2H, A), 7.46 (s, 2H, G), 7.29 (m, 6H, H+I), 7.24 (bs, 4H, C), 7.11 (d, J = 8.8 Hz, 4H, D), 6.86 (dd, J = 8.8, 2.1 Hz, 4H, E), 5.24 (s, 8H, F), 4.42 (t, J = 7.2 Hz, 8H, J), 1.52 (bm, 8H, K), 0.88 (bm, 24H, L+M+N), 0.51 (d, J = 6.7 Hz, 12H, O). ¹³C NMR (125 MHz, CDCl₃) δ 154.94, 150.20, 150.17, 143.40, 138.17, 137.90, 131.37, 128.95, 126.40, 126.00, 125.09, 115.17, 110.57, 105.66, 71.09, 44.84, 31.20, 30.05, 26.29, 22.40, 13.78. MALDI-MS: 1228.7 ([M]+H⁺).

Dissolved 25.1mg of 148 in 1.5mL CDCl3. Titrated thread stock solution (30mM) of 2 into solution of 148 until an exact 2:1 (2:148) ratio was formed (done by monitoring both the N-CH2 peaks on the alkyl groups of the bip ligands). The mixture was then diluted to a total volume to 3.5mL CDCl3 (5 mM 148). A stock solution of Fe(NTf2)2 (30mM in 1:1 CDCl3:d3-MeCN) was added until no free Bip peak appeared at ~2 equiv. of metal ion. The solvent was removed under vacuum resulting in a dark purple solid that was redissolved in 2mL dry 15% MeCN in CHCl3, bubbled with argon for 1 min, and allowed to stir under Ar at 45°C for 1 day to allow equilibration. Solvent was then removed under vacuum and 1H-NMR was recorded using 15% d3-MeCN in CDCl3.

**Figure S5.** Formation of 140:2:2:Fe(II)2.

**Figure S6.** Partial 1H-NMR overlay (500 MHz, 25°C, Solvent: 0, 3, 9, 15, 15% d3-MeCN in CDCl3 increasing upwards) of metal addition and 1 day equilibration. 1H assignments from Figure S9.
Assembly of Pseudo[3]rotaxane $1_{44}:2_{2}:\text{Fe(II)}_{2}$ from $1_{44}$ and 2

Dissolved 23.2 mg of $1_{44}$ in 1.5 mL CDCl$_3$. Titrated thread stock solution (30 mM) of 2 into solution of $1_{44}$ until an exact 2:1 ($2:1_{44}$) ratio was formed (done by monitoring both the N-CH$_2$ peaks on the alkyl groups of the bip ligands). The mixture was then diluted to a total volume to 3.5 mL CDCl$_3$ (5 mM $1_{44}$). A stock solution of Fe(NTF$_2$)$_2$ (30 mM in 1:1 CDCl$_3$; d$_3$-MeCN) was added until no free Bip peak appeared at ~2 equiv. of metal ion. The solvent was removed under vacuum resulting in a dark purple solid that was redissolved in 2 mL dry 15% MeCN in CHCl$_3$, bubbled with argon for 1 min, and allowed to stir under Ar at 45°C for 1 day to allow equilibration. Solvent was then removed under vacuum and $^1$H-NMR was recorded using 15% d$_3$-MeCN in CDCl$_3$.

Figure S7. Formation of $1_{44}:2_{2}:\text{Fe(II)}_{2}$.

Figure S8. Partial $^1$H-NMR overlay (500 MHz, 25°C, Solvent: 0, 3, 12, 15, 15% d$_3$-MeCN in CDCl$_3$ increasing upwards) of metal addition and 1 day equilibration. $^1$H assignments from Figure S11.
Assembly of Pseudo[3]rotaxane 1_{42}:2_{2}:Fe(II)_{2} from 1_{42} and 2

Dissolved 24.8mg of 1_{42} in 1.5mL CDCl_{3}. Titrated thread stock solution (30mM) of 2 into solution of 1_{42} until an exact 2:1 (2:1_{42}) ratio was formed (done by monitoring both the N-CH_{2} peaks on the alkyl groups of the bip ligands). The mixture was then diluted to a total volume to 4mL CDCl_{3} (5 mM 1_{42}). A stock solution of Fe(NTF_{2})_{2} (30mM in 1:1 CDCl_{3}:d_{3}-MeCN) was added until no free Bip peak appeared at ~2 equiv. of metal ion. The solvent was removed under vacuum resulting in a dark purple solid that was redissolved in 2mL dry 15% MeCN in CHCl_{3}, bubbled with argon for 1 min, and allowed to stir under Ar at 45°C for 1 day to allow equilibration. Solvent was then removed under vacuum and ^{1}H-NMR was recorded using 15% d_{3}-MeCN in CDCl_{3}.

Figure S9. Formation of 1_{42}:2_{2}:Fe(II)_{2}.

Figure S10. Partial ^{1}H-NMR overlay (500 MHz, 25°C, Solvent: 0, 3, 9, 15, 15% d_{3}-MeCN in CDCl_{3} increasing upwards) of metal addition and 1 day equilibration. ^{1}H assignments from Figure S13.
Assembly of Pseudo[3]rotaxane 1_{40}:2_{2}:Fe(II)$_2$ from 1$_{40}$ and 2

Dissolved 16.8 mg of 1$_{40}$ in 1.0 mL CDCl$_3$. Titrated thread stock solution (30 mM) of 2 into solution of 1$_{40}$ until an exact 2:1 (2:1$_{40}$) ratio was formed (done by monitoring both the N-CH$_2$ peaks on the alkyl groups of the bip ligands). The mixture was then diluted to a total volume to 3 mL CDCl$_3$ (5 mM 1$_{40}$). A stock solution of Fe(NTF$_2$)$_2$ (30 mM in 1:1 CDCl$_3$:d$_3$-MeCN) was added until no free Bip peak appeared at ~2 equiv. of metal ion. The solvent was removed under vacuum resulting in a dark purple solid that was redissolved in 1 mL dry 15% MeCN in CHCl$_3$, bubbled with argon for 1 min, and allowed to stir under Ar at 45°C for 1 day to allow equilibration. Solvent was then removed under vacuum and $^1$H-NMR was recorded using 15% d$_3$-MeCN in CDCl$_3$.

**Figure S11.** Formation of 1$_{40}$:2$_2$:Fe(II)$_2$.

**Figure S12.** Partial $^1$H-NMR overlay (500 MHz, 25°C, Solvent: 0, 3, 9, 15, 15% d$_3$-MeCN in CDCl$_3$ increasing upwards) of metal addition and 1 day equilibration. $^1$H assignments from Figure S15.
Stoppering of Pseudo[3]rotaxanes 1_{40-48}:2_{2}:Fe(II)$_2$

Stoppering With Stopper Component 3

Reference dumbbell component 7 was synthesized following a previously published procedure.\(^3\)

Figure S13. Synthesis of dumbbell component 7.\(^3\)

Figure S14. Attempted stoppering and demetallation of 1$_{44}$:2$_2$:Fe(II)$_2$ with 3 to make 5$_{44}$. 

1$_{44}$:2$_2$:Fe(II)$_2$ (8.8 mg, 0.0022 mmol), 3 (11.4 mg, 0.013 mmol, 6 eq) and sodium ascorbate (4.4 mg, 0.022 mmol, 10 eq) were added to a 4mL glass vial purged with Ar. To this mixture was added CH$_2$Cl$_2$ (0.35 mL, conc of alkyne = 25 mM), H$_2$O (0.25 mL), and 100μL of an aqueous stock solution of Cu(SO$_4$)$_2$:5H$_2$O (22 mM, 0.0022 mmol, 1 eq, (25mol% per alkyne)). The reaction was stirred vigorously for 18 h at RT. After this time the reaction mixture was diluted with CH$_2$Cl$_2$ and H$_2$O (5 mL each). The organic layer was taken and washed with H$_2$O (2 × 5 mL). Removal of organic solvent resulted in a purple solid that was washed 3x with 5mL of 5% chloroform in hexanes to help remove leftover stopper group. The crude purple solid was redissolved in 4mL of 50:50 dichloromethane and acetonitrile and stirred slowly at room temperature. 2mL of tetrabutylammonium hydroxide solution (1M in MeOH) were added dropwise
to the stirring solution resulting in a rapid color change from purple to light brown and precipitation of demetallated product. After 15 minutes of stirring an off-white solid was filtered off and washed with methanol (2 x 10 mL) to remove excess base. The frit was then washed with 2 mL of CDCl₃ to redissolve the demetallated product and transferred to an NMR tube for immediate analysis.

**Figure S15.** Stoppering and demetallation of 1₄₂:2₂:Fe(II)₂ with 3 to make 5₄₂.

1₄₂:2₂:Fe(II)₂ (20.9 mg, 0.0055 mmol), 3 (27.7 mg, 0.033 mmol, 6 eq) and sodium ascorbate (10.6 mg, 0.055 mmol, 10 eq) were added to a 4 mL glass vial purged with Ar. To this mixture was added CH₂Cl₂ (0.85 mL, conc of alkyne = 25 mM), H₂O (0.75 mL), and 100 μL of an aqueous stock solution of Cu(SO₄)·5H₂O (55 mM, 0.0055 mmol, 1 eq, (25 mol% per alkyne)). The reaction was stirred vigorously for 18 h at RT. After this time the reaction mixture was diluted with CH₂Cl₂ and H₂O (5 mL each). The organic layer was taken and washed with H₂O (2 x 5 mL). Removal of organic solvent resulted in a purple solid that was washed 3x with 10 mL of 5% chloroform in hexanes to help remove leftover stopper group. The crude purple solid was redissolved in 5 mL of 50:50 dichloromethane and acetonitrile and stirred slowly at room temperature. 2 mL of tetrabutylammonium hydroxide solution (1M in MeOH) were added dropwise to the stirring solution resulting in a rapid color change from purple to light brown and precipitation of demetallated product. After 15 minutes of stirring an off-white solid was filtered off and washed with methanol (2 x 10 mL) to remove excess base. The frit was then washed with 5 mL of CHCl₃ to redissolve the demetallated product and washed once with 5 mL water. Solvent was removed under reduced pressure resulting in an off-white residue. Purification of 5₄₂ was achieved using preparative thin layer chromatography (SiO₂, eluent = 94:6 CHCl₃:MeOH, lowest Rf band taken (Rf = 0.1 - 0.35) as [3]R product, macrocycle byproduct Rf = 0.45, dumbbell byproduct Rf = 0.60 - 0.70) followed by precipitation from cold methanol to result in an off-white solid, 5₄₂ in 34% isolated yield (11.1 mg). ¹H-NMR (500 MHz, CDCl₃) δ 8.30 (d, J = 7.9 Hz, 4H), 7.98 (d, J = 7.7 Hz, 4H), 7.98-7.80 (m, 6H), 7.63 (t, J = 7.7 Hz, 2H), 7.55-7.45 (m, 56H), 7.42 (d, J = 8.0 Hz, 24H), 7.36 (d, J = 8.2 Hz, 8H), 7.34-7.28 (m, 36H), 7.20 (s, 4H), 7.18 (d, J = 8.0 Hz, 8H), 6.79-6.74 (m, 8H), 6.72-6.65 (m, 8H), 5.15 (bs, 8H), 4.72 (bs, 8H), 4.32-4.20 (m, 16H), 3.83 (bt, 8H), 3.73 (bt, 8H), 3.64 (bt, 8H), 3.54 (bt, 8H), 2.67 (bt, 8H), 1.93 (bt, 8H), 1.40 (m, 8H), 1.33 (s, 108H),
1.26 (bt, 12H), 0.85-0.72 (m, 24H), 0.58 (t, J = 7.1Hz, 12H). MALDI-MS: 5981.1 ([M]+H+), 3605.8 ([M]+H+-DB(7)), 2378.1 ([M]+H+-MC(142)-DB(7)).

Figure S16. Stoppering and demetallation of 1_{40}:2_{2}:Fe(II) with 3 to make 5_{40}.

1_{40}:2_{2}:Fe(II) (20.1 mg, 0.0053mmol), 3 (26.0 mg, 0.032 mmol, 6eq) and sodium ascorbate (10.2 mg, 0.053 mmol, 10 eq) were added to a 4mL glass vial purged with Ar. To this mixture was added CH2Cl2 (0.80 mL, conc of alkyne = 25 mM), H2O (0.70 mL), and 100μL of an aqueous stock solution of Cu(SO4)·5H2O (53 mM, 0.0053mmol, 1eq, (25mol% per alkyne)). The reaction was stirred vigorously for 18 h at RT. After this time the reaction mixture was diluted with CH2Cl2 and H2O (5 mL each). The organic layer was taken and washed with H2O (2 × 5 mL). Removal of organic solvent resulted in a purple solid that was washed 3x with 10mL of 5% chloroform in hexanes to help remove leftover stopper group. The crude purple solid was redissolved in 5mL of 50:50 dichloromethane and acetonitrile and stirred slowly at room temperature. 2mL of tetrabutylammonium hydroxide solution (1M in MeOH) were added dropwise to the stirring solution resulting in a rapid color change from purple to light brown and precipitation of demetallated product. After 15 minutes of stirring an offwhite solid was filtered off and washed with methanol (2x 10mL) to remove excess base. The frit was then washed with 5mL of CHCl3 to redissolve the demetallated product and washed once with 5mL water. Solvent was removed under reduced pressure resulting in an off-white residue. Purification of 5_{40} was achieved using preparative thin layer chromatography (SiO2, eluent = 94:6 CHCl3:MeOH, lowest Rf band taken (Rf=0.1-0.35) as [3]R product, macrocycle byproduct Rf=0.45, dumbbell byproduct Rf=0.60-0.70) followed by precipitation from cold methanol to result in an off-white solid, 5_{40} in 42% isolated yield (13.2 mg). 1HNMR (500 MHz, CDCl3) δ 8.33 (d, J = 7.8Hz, 4H), 8.01 (d, J = 7.7Hz, 4H), 7.97 (t, J = 7.8Hz, 2H), 7.91 (s, 4H), 7.77 (t, J = 7.7Hz, 2H), 7.55-7.45 (m, 56H), 7.42 (d, J = 8.0Hz, 24H), 7.36 (d, J = 8.3Hz, 8H), 7.34-7.28 (m, 36H), 7.22 (s, 4H), 7.15 (d, J = 8.4 Hz, 8H), 6.88 (d, J = 8.8 Hz, 4H), 6.78-6.69 (m, 12H), 6.63 (d, J = 8.4 Hz, 8H), 5.00 (bs, 8H), 4.73 (bq, 8H), 4.31 (bt, 8H), 4.22 (bt, 8H), 3.77 (bm, 16H), 3.60 (bt, 8H), 3.47 (bt, 8H), 2.69 (bt, 8H), 1.95 (bt, 8H), 1.44 (m, 8H), 1.33 (s, 108H), 1.26 (bt, 12H), 0.89-0.75 (m, 24H), 0.58 (t, J = 7.0Hz, 12H). MALDI-MS: 5981.9 ([M]+H+), 3605.1 ([M]+H+-DB(7)), 2377.9 ([M]+H+-MC(1_{40})-DB(7)).
Reference dumbbell component 8 was synthesized following a previously published procedure.³
Figure S18. Attempted stoppering and demetallation of 1:2:Fe(II) with 4 to make 6.

1:2:Fe(II) (11.0 mg, 0.0027 mmol), 4 (28.6 mg, 0.016 mmol, 6 eq) and sodium ascorbate (5.2 mg, 0.027 mmol, 10 eq) were added to a 4mL glass vial purged with Ar. To this mixture was added CH$_2$Cl$_2$ (0.43 mL, conc of alkyne = 25 mM), H$_2$O (0.33 mL), and 100μL of an aqueous stock solution of Cu(SO$_4$)·5H$_2$O (27mM, 0.0027mmol, 1eq, (25mol% per alkyne)). The reaction was stirred vigorously for 18 h at RT. The reaction mixture was then diluted with CH$_2$Cl$_2$ and H$_2$O (5 mL each). The organic layer was collected and washed with H$_2$O (2 × 5 mL). Removal of organic solvent resulted in a purple solid that was washed 3x with 5mL of 10% chloroform in hexanes to help remove leftover stopper group. The crude purple solid was redissolved in 3mL of 50:50 dichloromethane and acetonitrile and stirred slowly at room temperature. 0.5mL of tetrabutylammonium hydroxide solution (1M in MeOH) was added dropwise to the stirring solution resulting in a rapid color change from purple to light brown and precipitation of demetallated product. After 15 minutes of stirring, an off-white solid was filtered off and washed with methanol (2x 10mL). The frit was then washed with 2mL of CDCl$_3$ to redissolve the demetallated product and analyzed immediately via 1H-NMR spectroscopy and MALDI-TOF mass spectrometry.
Figure S19. Stoppering and demetallation of 1_{44}:2_{2}:Fe(II) with 4 to make 6_{44}.

1_{44}:2_{2}:Fe(II) (15.8 mg, 0.004 mmol), 4 (43.1 mg, 0.024 mmol, 6 eq) and sodium ascorbate (8.0 mg, 0.04 mmol, 10 eq) were added to a 4mL glass vial purged with Ar. To this mixture was added CH_{2}Cl_{2} (0.65 mL, conc of alkyne = 25 mM), H_{2}O (0.55 mL), and 100μL of an aqueous stock solution of Cu(SO_{4})·5H_{2}O (40mM, 0.004mmol, 1eq, (25mol% per alkyne)). The reaction was stirred vigorously for 18 h at RT. The reaction mixture was then diluted with CH_{2}Cl_{2} and H_{2}O (5 mL each). The organic layer was collected and washed with H_{2}O (2 x 5 mL). Removal of organic solvent resulted in a purple solid that was washed 3x with 5mL of 10% chloroform in hexanes to help remove leftover stopper group. The crude purple solid was redissolved in 5mL of 50:50 dichloromethane and acetonitrile and stirred slowly at room temperature. 1mL of tetrabutylammonium hydroxide solution (1M in MeOH) was added dropwise to the stirring solution resulting in a rapid color change from purple to light brown and precipitation of demetallated product. After 15 minutes of stirring, an off-white solid was filtered off and washed with methanol (2 x 10mL). The filtrate was then washed with 5mL of CHCl_{3} to redissolve the demetallated product and washed once with 5mL water. Solvent was removed under reduced pressure resulting in an off-white residue. Purification of 6_{44} was achieved using preparative thin layer chromatography (SiO_{2}, eluent = 94:6 CHCl_{3}:MeOH, lowest Rf band taken (Rf=0.05-0.30) as [3]R product, macrocycle byproduct Rf=0.4, dumbbell byproduct Rf=0.65-0.75) followed by precipitation from cold methanol to result in an off-white solid, 6_{44} in 75% isolated yield (29.5 mg). \textsuperscript{1}H-NMR (500 MHz, CDCl_{3}) δ 8.25 (d, J = 7.8Hz, 4H), 7.98 (d, J = 7.8Hz, 4H), 7.91 (s, 4H), 7.85 (t, J = 7.9Hz, 2H), 7.67 (t, J = 7.9Hz, 2H), 7.63 (d, J = 8.5Hz, 4H), 7.55-7.45 (m, 108H), 7.42 (d, J = 8.5Hz, 48H), 7.37 (d, J = 8.6 Hz, 8H), 7.31-7.28 (m, 52H), 7.21-7.15 (m, 20H), 6.84-6.70 (m, 28H), 6.66 (d, J = 8.6 Hz, 8H), 6.47 (bs, 4H), 6.34 (bd, 8H), 5.29 (bs, 8H), 5.15 (s, 8H), 4.62 (bq, J = 7.2 8H), 4.30 (bt, 8H) 4.12-4.00 (m, 32H), 3.88-3.76 (m, 32H), 3.58 (bt, 8H), 2.47 (bt, 8H), 1.70 (bt, 8H), 1.36 (m, 8H), 1.33 (s, 216H), 1.18 (t, J = 7.2Hz, 12H), 0.89 -0.69 (m, 24H), 0.50 (t, J = 7.0Hz, 12H). MALDI-MS: 9,782.3 ([M]+H\textsuperscript{+}), 5,554.5 ([M]+H\textsuperscript{+}-DB(8)), 4,226.9 ([M]+H\textsuperscript{+}-MC(1_{44})-DB(8)).
Figure S20. Stoppering and demetallation of 1\textsubscript{42}:2\textsubscript{2}:Fe(II)\textsubscript{2} with 4 to make 6\textsubscript{42}.

1\textsubscript{42}:2\textsubscript{2}:Fe(II)\textsubscript{2} (18.2 mg, 0.0047 mmol), 4 (50.1 mg, 0.029 mmol, 6 eq) and sodium ascorbate (9.3 mg, 0.047 mmol, 10 eq) were added to a 4mL glass vial purged with Ar. To this mixture was added CH\textsubscript{2}Cl\textsubscript{2} (0.76 mL, conc of alkyne = 25 mM), H\textsubscript{2}O (0.66 mL), and 100μL of an aqueous stock solution of Cu(SO\textsubscript{4})\textsubscript{2}·5H\textsubscript{2}O (47mM, 0.0047mmol, 1eq, (25mol% per alkyne)). The reaction was stirred vigorously for 18 h at RT. The reaction mixture was then diluted with CH\textsubscript{2}Cl\textsubscript{2} and H\textsubscript{2}O (5 mL each). The organic layer was collected and washed with H\textsubscript{2}O (2 × 5 mL). Removal of organic solvent resulted in a purple solid that was washed 3x with 5mL of 10% chloroform in hexanes to help remove leftover stopper group. The crude purple solid was redissolved in 5mL of 50:50 dichloromethane and acetonitrile and stirred slowly at room temperature. 1mL of tetrabutylammonium hydroxide solution (1M in MeOH) was added dropwise to the stirring solution resulting in a rapid color change from purple to light brown and precipitation of demetallated product. After 15 minutes of stirring, an off-white solid was filtered off and washed with methanol (2x 10mL). The frit was then washed with 5mL of CHCl\textsubscript{3} to redissolve the demetallated product and washed once with 5mL water. Solvent was removed under reduced pressure resulting in an off-white residue. Purification of 6\textsubscript{42} was achieved using preparative thin layer chromatography (SiO\textsubscript{2}, eluent = 94:6 CHCl\textsubscript{3}:MeOH, lowest Rf band taken (Rf=0.1-0.3) as [3]R product, macrocycle byproduct Rf=0.4, dumbbell byproduct Rf=0.65-0.75) followed by precipitation from cold methanol to result in an off-white solid, 6\textsubscript{42} in 73% isolated yield (33.5 mg). \textsuperscript{1}H-NMR (500 MHz, CDCl\textsubscript{3}) δ 8.28 (d, J = 7.8Hz, 4H), 7.92 (d, J = 7.8Hz, 4H), 7.90-7.84 (m, 6H), 7.56-7.44 (m, 106H), 7.42 (d, J = 8.5 Hz, 48H), 7.32-7.28 (m, 56H), 7.22-7.18 (m, 28H), 6.98 (s, 4H), 6.81 (d, J = 8.9 Hz, 16H), 6.76-6.70 (m, 8H), 6.53 (d, J = 8.2 Hz, 8H), 6.48 (bs, 4H), 6.41 (bd, J = 2.0 Hz, 8H), 5.25 (bs, 8H), 5.14 (bs, 8H), 4.71 (bq, 8H), 4.25 (bt, 8H), 4.12-4.02 (m, 32H), 3.89-3.79 (m, 32H), 3.53 (bt, 8H), 2.49 (bt, 8H), 1.73 (bt, 8H), 1.36 (m, 8H), 1.33 (s, 216H), 1.26 (t, J = 7.2H, 12H), 0.90-0.70 (m, 24H), 0.47 (t, J = 6.9Hz, 12H). Figure S58. Chemical structure of $6_{46}$, $6_{44}$, $6_{42}$, and $6_{40}$ with arrows showing intercomponent NOEs found in each [3]rotaxane.

Kinetic experiments were modeled after previously published work detailing the slippage of 646 which was based on initial work by Sauvage and coworkers. A 1mM sample of freshly purified [3]rotaxane 640, 642, 644, 540, or 542 was prepared in a 5 mm Bruker Shigemi NMR tube. This tube was sealed, stored at room temperature (25°C), and its 1H-NMR spectrum was recorded after 3 days, 7 days, 10 days, 14 days, 17 days, and finally 21 days. For the rotaxane 542 a quicker sampling time of 4 hours of slippage and then once a day for 1 week was used.

The resulting kinetic data was analyzed according to the following method. The downfield doublet corresponding to the proton labeled B in the dumbbell of each [3]rotaxane (See Fig 3) was used to determine the amount of [3]R left in each sample as the shift between free and interlocked species was diagnostic and clean of other peaks. The free B doublet is in the region 8.34-8.38ppm and the interlocked B doublet is in the region 8.22-8.34ppm (slight shift depending on specific [3]rotaxane, see Fig 4 + 5). Let C₀ be the initial concentration of [3]rotaxane and C be the concentration of [3]rotaxane at timepoint t. The absolute integral intensity of B that is interlocked (I₆[R]) divided by the sum of the absolute integral intensities of B that is free and interlocked (I₆[B] + I₆[R]) multiplied by 100% gives the percent of [3]R remaining in the sample. Dividing this percent rotaxane remaining by the initial rotaxane percent present is equivalent to C/C₀ for each timepoint of slippage. Following standard first-order kinetics the kinetic parameters were determined.
Slippage Analysis of [3]Rotaxanes 6_{44} and 5_{40-42}

Figure S59. Partial $^1$H-NMR overlay (1mM, 500 MHz, CDCl$_3$, 25°C) of 3 trials of 3-week room temperature slippage experiments of 6_{44}. Examples integrals in bottom right corner of figure display integral values used in trial 1 of kinetic measurements.
Figure S60. Partial $^1$H-NMR overlay (1mM, 500 MHz, CDCl$_3$, 25°C) of 3 trials of 3-week room temperature slippage experiments of S$_{40}$. Examples integrals in bottom right corner of figure display integral values used in trial 1 of kinetic measurements.
Figure S61. Partial $^1$H-NMR overlay (1mM, 500 MHz, CDCl$_3$, 25°C) of 3 trials of 3-week room temperature slippage experiments of 5$_{42}$. Examples integrals in bottom right corner of figure display integral values used in trial 1 of kinetic measurements.
Figure S62. Kinetic first-order plot of three trials of slippage of each [3]rotaxane 6_{44} and 5_{40-42}. 
Figure S63. Partial $^1$H-NMR overlay (1mM, 500 MHz, CDCl$_3$, 25°C) of 3 trials of 3-week room temperature slippage experiments of 6$_{40}$. Time between measurements indicated on left side.
Figure S64 Partial $^1$H-NMR overlay (1mM, 500 MHz, CDCl$_3$, 25°C) of 3 trials of 3-week room temperature slippage experiments of 642. Time between measurements indicated on left side.
$^1$H and $^{13}$C NMR Spectra of Ring Components 140-48

Figure S65. $^1$H-NMR (500 MHz, 25°C, CDCl$_3$) of ring component 140.

Figure S66. $^{13}$C-NMR (126 MHz, 25°C, CDCl$_3$) of ring component 140.
**Figure S67.** $^1$H-NMR (500 MHz, 25°C, CDCl$_3$) of ring component 1$_{42}$.

**Figure S68.** $^{13}$C-NMR (126 MHz, 25°C, CDCl$_3$) of ring component 1$_{42}$.
Figure S69. $^1$H-NMR (500 MHz, 25°C, CDCl$_3$) of ring component 1$_{44}$.

Figure S70. $^{13}$C-NMR (126 MHz, 25°C, CDCl$_3$) of ring component 1$_{44}$. 
Figure S71. $^1$H-NMR (500 MHz, 25°C, CDCl$_3$) of ring component 1$_{48}$.

Figure S72. $^{13}$C-NMR (126 MHz, 25°C, CDCl$_3$) of ring component 1$_{48}$.
