1. General information

Column chromatography was performed using silica gel (200-300 mesh) or thin layer chromatography was performed using silica gel (GF254). IR spectra were recorded on a new Fourier transform infrared spectroscopy. ^1H and ^{13}C NMR spectra were recorded on 400, 100 MHz NMR spectrometer using CDCl_3 as solvent unless otherwise stated. HRMS were made by means of ESI with the Thermo Scientific LTQ Orbitrap XL mass spectrometer. Unless otherwise noted, all reagents were weighed and handled in air, and all reactions were carried out in a sealed tube under an atmosphere of argon. Oil bath was used for reactions that require heating. Unless otherwise noted, reagents were purchased from commercial suppliers and used without further purification.
