## **1. Experimental Part.**

### **1.1. General Information.**

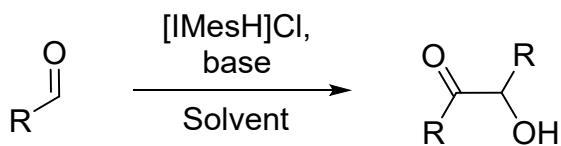

Commercially available starting compounds, reagents and solvents were of analytical grade. Imidazolium salts were obtained by using published synthetic protocols or purchased commercially. NMR spectra were recorded using a Bruker Avance 300 spectrometer operating at 300.1 MHz for <sup>1</sup>H and 75.5 MHz for <sup>13</sup>C. NMR chemical shifts were measured relative to residual solvent peaks. The processing was carried out using the MestReNova software.

### **1.2. Mechanistic experiments.**

We conducted a comparative experimental study on the catalytic activity of 1,3-bis(2,4,6-trimethylphenyl)-imidazol-2-ylidene (IMes) and 1,3-bis(2,6-diisopropylphenyl)-imidazol-2-ylidene (IPr) in the benzoin condensation reaction with various aromatic aldehydes and isobutyraldehyde. The results of these experiments are presented in Tables S1 and S2. The NHCs were generated *in situ* in the H-bonded form by deprotonating the appropriate imidazolium cations with DBU or sodium *tert*-butoxide, following previously reported methods.<sup>[1]</sup> The best selectivity was observed for the reactions with furaldehydes under ambient conditions for 24 hours. In contrast, benzaldehydes exhibited lower reactivity (Table S1, entries 6-9; Table S2, entries 6-8), and isobutyraldehyde was almost inactive (Table S1, entry 10; Table S2, entry 9). Additionally, we investigated the influence of solvent on the selectivity of the benzoin condensation of furfural. The best results were obtained when using THF and methanol as solvents, while the reactions conducted under solvent-free conditions showed the lowest efficiency (Table S1, entries 11-16; Table S2, entries 10-16).

**General procedure for benzoin condensation.** A mixture of aldehyde (0.5 mmol), imidazolium chloride (0.05 mmol) and a base (0.5 mmol) in deuterated solvent was treated at the appropriate temperature and time conditions (24 h at 22 °C or 3 h at 80 °C) under an argon atmosphere. The degree of conversion and the yield of benzoin condensation products were measured by NMR using DBU or PhSiMe<sub>3</sub> as internal standard.

## 2. Computational details.

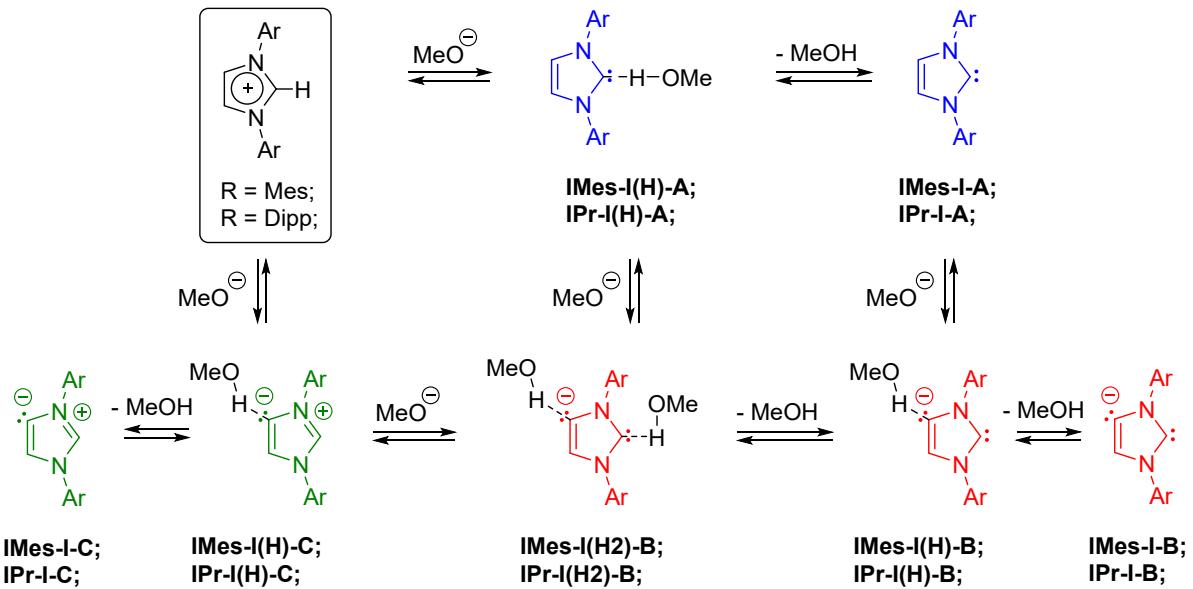

The reaction energy profiles of the benzoin condensation of furfural *via* paths A, B, and C (Schemes S3–S5) were calculated using the ORCA v.4.2.1 software<sup>[1]</sup> at the PBE0/Def2TZVP level<sup>[2]</sup> in the frame of the CPCM solvation model<sup>[3]</sup> with MeOH parameters. For acceleration, the RIJCOSX approximation<sup>[4]</sup> with the Def2/j fitting<sup>[5]</sup> basis set was used. Frequencies and eigenvectors of normal modes were calculated in harmonic approximation for all the reaction participants; virtual modes were absent for the intermediates, whereas one virtual mode was found for the transition states. The optimized xyz-Cartesian coordinates are presented in Section 3. The calculated arbitrary energies for the reaction participants are provided in Table S3 (R = Mes) and Table S4 (R = Dipp). The orbital-weighted Fukui<sup>[6]</sup> indices at the same level for the intermediates **IMes-III-A**, **IMes-III-B**, and **IMes-III-C** (Tables S7–S9) were calculated using the MultiWFN software v.3.7.<sup>[7]</sup>
