1. General Information

All reagents and solvents were purchased from TCI, Sigma-Aldrich, Alfa Aesar, Acros and Meryer. All reactions were conducted using standard Schlenk techniques. Column chromatography was performed using EM silica gel 60 (300 – 400 mesh). $^1$H NMR and $^{13}$C NMR spectra were measured on a 400 MHz Bruker AVANCE spectrometer, using DMSO-$d_6$ or CDCl$_3$ as the solvent with tetramethylsilane (TMS) as the internal standard at room temperature. Chemical shifts were reported in ppm. $^1$H NMR spectra were referenced to CDCl$_3$ (7.26 ppm) or DMSO-$d_6$ (2.50 ppm), and $^{13}$C NMR spectra were referenced to CDCl$_3$ (77.0 ppm) or DMSO-$d_6$ (39.5 ppm). Peak multiplicities were designated by the following abbreviations: s, singlet; d, doublet; t, triplet; m, multiplet; q, quartet. Chemical shifts are given in $\delta$ relative to TMS, the coupling constants $J$ are given in Hz. Analysis of crude reaction mixture was done on the Varian 4000 GC/MS and Agilent 7890A/5975C. High-resolution mass spectra were recorded on a micrOTOF-Q II 10410 mass spectrometer. A 15 W UV light and a 500 W super high-pressure mercury lamp were used for photoirradiation. Unless otherwise noted, all reagents and solvents were obtained commercially and used without further purification. The cyclopropenones$^1$ were prepared according to corresponding literature procedures.
2. General Experimental Procedures

General procedure (method A, 3aa-3ia, 3ab-3aj)

A 10 mL pressure tube equipped with a stir bar was charged with cyclopropenones (0.2 mmol, 1.0 equiv.), dicarbonyl compounds (0.4 mmol, 2.0 equiv), PPh3 (0.002 mmol, 0.01 equiv.) and PhCF3 (2 mL). The reaction mixture was stirred at room temperature under N2 atmosphere for 12 h. After completion of the reaction, the reaction mixture was concentrated under reduced pressure, then 2.0 ml of water was added, and the reaction solution was extracted with ethyl acetate (3 x 2 mL), the combined organic layers were dried over anhydrous magnesium sulfate, filtered and evaporated under reduced pressure. The residue was then purified by flash chromatography on silica gel to provide the corresponding product.

3. Mechanism study

3.1 The reaction of zwitterionic phosphine/cyclopropenone adduct A with ethyl acetoacetate

A solution of 1,2-diphenylcyclopropenone (1.03 g, 5 mmol) and PPh3 (1.31 g, 5 mmol) in dry benzene solution was stirred at room temperature under nitrogen
atmosphere for 3 h to give the zwitterionic phosphine/cyclopropenone adduct A.\(^2\)
(orange crystal, 2.1 g, 91%). \(^1\)H NMR (400 MHz, CDCl\(_3\)) \(\delta\) 7.75 (m, 2H), 7.37 – 7.34

Then a 10 mL pressure tube equipped with a stir bar was charged with A (0.2 mmol,
1.0 equiv.), ethyl acetoacetate (0.4 mmol, 2.0 equiv.) and dry PhCF\(_3\) (2 mL). The
reaction mixture was stirred at room temperature under N\(_2\) atmosphere for 12 h. After
completion of the reaction, the reaction mixture was concentrated under reduced
pressure. The residue was then purified by flash chromatography on silica gel to
provide the corresponding product 3aa (55.1 mg, 82%).
