## 2. NOESY Spectrum of the Product 3e

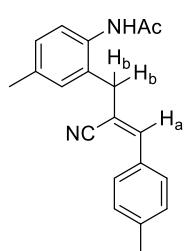

1. The  $^1\text{H}$  NMR shows 4 types of aromatic hydrogens with the splitting pattern of doublet which correlates with *para* isomer.
2. No cross peak is observed between minor  $H_b$  and  $H_a$  in the 2D NMR spectrum. Also, no cross peak between  $H_b$  and  $\text{CH}_3\text{CO}$  that suggests that the *ortho* isomer is not formed
3. NOE correlation is observed between  $H_a$  ( $\delta$  6.89, s) and  $H_b$  ( $\delta$ , 3.65, s). Based on the  $^1\text{H}$  NMR and NOESY Spectrum of **3e**, it is concluded that the major product is (Z)-isomer with the Z/E ratio 87:13.

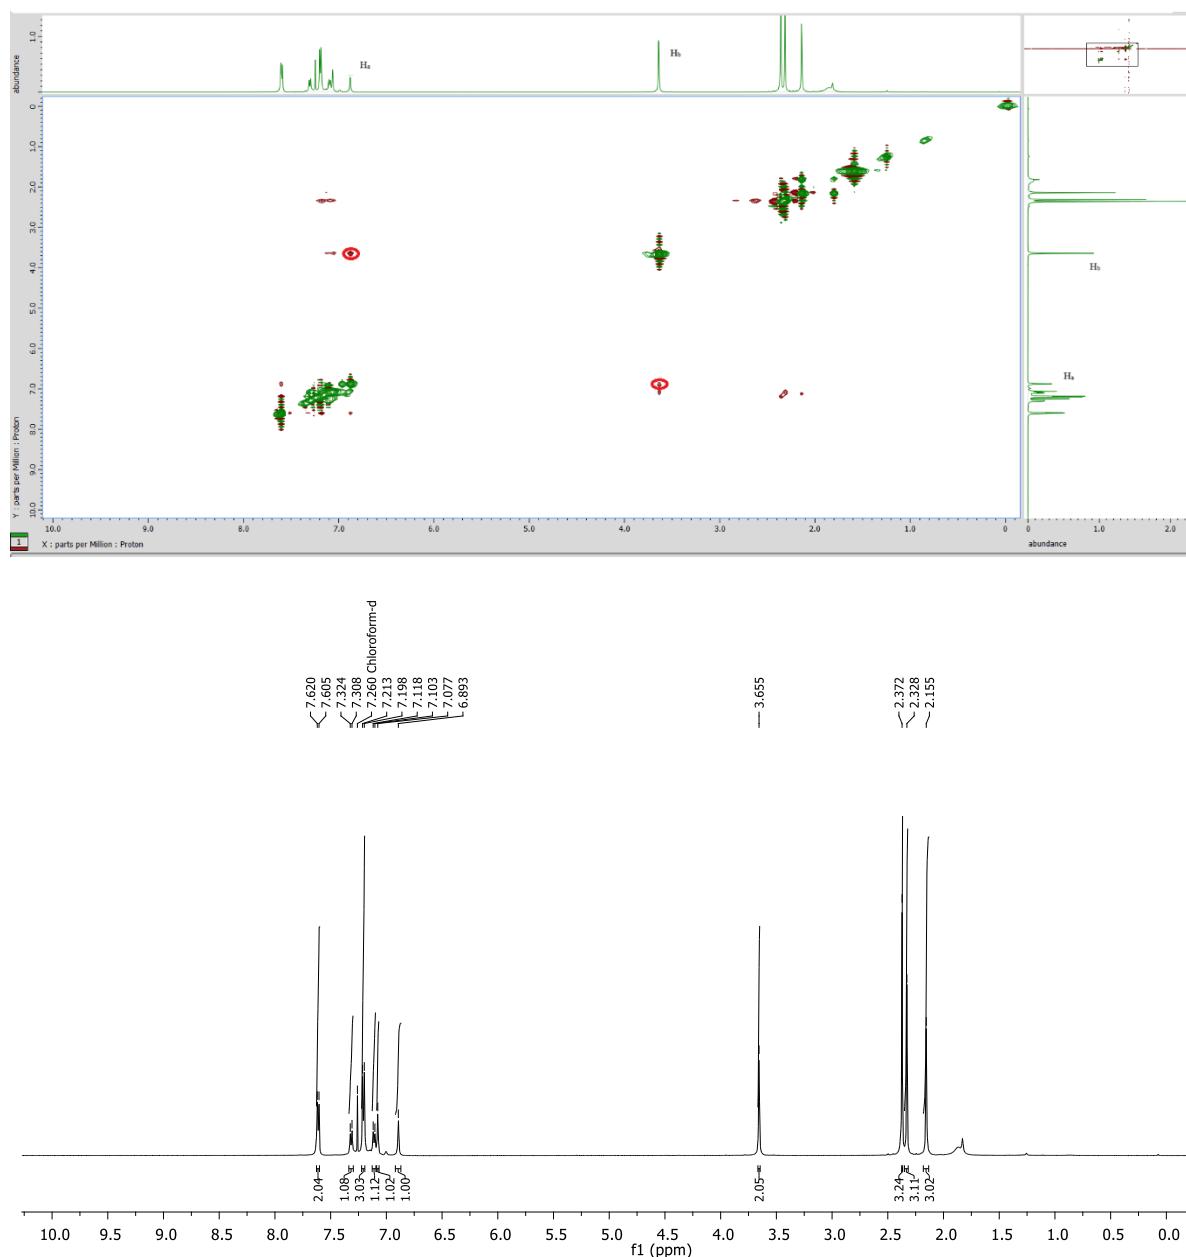

$^1\text{H}$  NMR of **3e**

### 3. NOESY Spectrum of the Product **4b**

NOE correlation is observed between  $\text{H}_a$  ( $\delta$  6.89, s) and  $\text{H}_b$  ( $\delta$ , 3.66, s). Based on the  $^1\text{H}$  NMR and NOESY Spectrum of **4b**, it is concluded that the product is (*Z*)-isomer.
