Experimental Procedures

1/ Chemical compounds. T-VPI and VPI-N were obtained following previously described procedures.[1] D$_2$O, TFA (deuterated trifluoroacetic acid) and DCl in D$_2$O (3.5%) were purchased from commercial sources (Aldrich, Acros, ABCR or TCI) and used without further purification. HPLC grade water (purchased from Sigma-Aldrich) was used as deionized water. CB[8] was prepared according to a previous paper.[2] CB[10] was obtained following a previously described procedure.[3] Di-tolyl viologen (TVT) was obtained from a previously reported procedure.[4]

2/ NMR measurements. NMR measurements were recorded on Bruker AVL 300, 400 and 500 spectrometers (1H-NMR 300.13, 400.13 MHz and 13C-NMR 100.60, and 125.75 MHz). When using D$_2$O as the solvent (internal reference, 4.75 ppm) a watergate sequence (water suppress) was applied if necessary. Acetone was also used as internal reference for D$_2$O solutions (ref 2.22 ppm).[5] Splitting patterns are indicated as follows: s, singlet; d, doublet; dd, doublet of doublet; t, triplet; m, multiplet. 2D NMR spectra (COSY and ROESY) were recorded using standard Bruker sequences. ROESY spectra for the CB[8]•T-VPI$_2$ complex was not attempted owing to large signals in the aromatic region usually affording spectra with no cross-peaks. Similarly, the ROESY of the CB[10]•VPI-N$_3$ complex was not recorded for the same reason, but ROESY was obtained for this complex in acidic conditions (sharper peaks compared to neutral conditions, see Figure S33).

3/ ITC measurements. Isothermal Titration Calorimetry (ITC) was performed on a Malvern MicroCal PEAQ-ITC at 25 °C. A 1 mM stock solution of VPI-N (syringe) was diluted in HPLC grade water (cell) for investigating dimer formation. Results were analyzed using the Malvern MicroCal PEAQ-ITC Analysis Software 1.1.0.1262 considering the dissociation model. For T-VPI (1 mM, syringe), titrations were performed with CB[8] solutions at 40 μM in HPLC grade water (cell). For VPI-N (1 mM, syringe), titrations were performed with CB[8] solutions at 40 μM in HPLC grade water (cell). Results were analyzed using the Malvern MicroCal PEAQ-ITC Analysis Software 1.1.0.1262 considering the one set of sites binding model. The reduced Chi square value [(kJ/mol)$^2$] for each titration is indicated hereafter: VPI-N dilution: 0.036, T-VPI with CB[8]: 0.353, VPI-N with CB[8]: 0.385.

4/ Absorption and fluorescence spectroscopies. UV-visible absorption spectra were recorded in spectrophotometric grade water (ca. 10$^{-5}$ M) on a VARIAN CARY 50 SCAN spectrophotometer at room temperature with a 300 nm/min scan rate. Emission spectra were measured using a Horiba-Jobin Yvon Fluorolog-3 spectrofluorimeter equipped with a three-slit double-grating excitation and a spectrograph emission mono-chromator with dispersions of 2.1 nm.mm$^{-1}$ (1200 grooves per mm). A 450 W xenon continuous wave lamp provided excitation. The luminescence of diluted solutions was detected at right angle using 10 mm quartz cuvettes. Excitation: the luminescence of diluted solutions was detected at right angle using 10 mm quartz cuvettes. Fluorescence quantum yields $\Phi$ were measured in diluted absolute ethanol solution with an optical density lower than 0.1 using the following equation:

$$\Phi = \left(\frac{A_\lambda}{n^2 \cdot D_\lambda}\right) \left(\frac{n^2_\lambda \cdot D_\lambda}{A_\lambda}\right)$$

where $A$ is the absorbance at the excitation wavelength ($\lambda$), $n$ the refractive index and $D$ the integrated intensity. "$r$" and "$x$" stand for reference and sample. The fluorescence quantum yields were measured relative to anthracene in ethanol ($\Phi = 27\%$). Excitation of reference and sample compounds was performed at the same wavelength, ie. 290 nm for T-VPI and 310 nm for VPI-N and T-V-T.

Figure S6. ITC thermogram corresponding to the dilution of a 1 mM solution of VPI-N in water.
8/ $^1$H NMR titration of T-VPI with CB[8]

**Figure S7.** $^1$H NMR (500 MHz, D$_2$O, 298 K, 0.45 mM) of compound CB[8]₂•T-VPI₂.

9/ $^1$H NMR titration of VPI-N with CB[8]

**Figure S8.** $^1$H NMR (500 MHz, D$_2$O, 298 K, 0.45 mM) of compound CB[8]₂•VPI-N₂.
Preparation and NMR spectra of CB[8]•T-VPI₂

A 0.45 mM solution of CB[8]•T-VPI₂ was prepared from a mixture of 0.84 mg of solid CB[8] (6.3 × 10⁻⁷ mol, 1.2 equiv.), 263 µL of a 2 mM stock solution of T-VPI (5.3 × 10⁻⁷ mol in D₂O and 370 µL of D₂O. Acetone was used as internal reference (2.22 ppm).

According to the integral value of signals H5 (9.19 ppm, I = 4.00) and the integral value of CB[8] protons (5.83-5.69 ppm, I = 44.20), a CB[8]/T-VPI ratio of 2.76/2 is determined.

\[^{1}\text{H} \text{NMR (500 MHz, D}_2\text{O) \delta 9.19 \text{ (br s, 4H, H5), 9.05 (br s, 4H, H2), 8.38 (br s, 8H, overlapped signals of H6 and H7), 8.01 (br s, 4H, Hx), 7.68 (br s, 4H, Hx), 7.22 (s, 4H, H4), 7.11 (s, 4H, H3), 6.69 (s, 4H, H8 or H9), 6.21 (s, 4H, H8 or H9), 5.83 – 5.69 (m, 32H, CB[8]), 5.52 (s, 32H, CB[8]), 4.17 (app t, } J = 37.3 \text{ Hz, 32H, CB[8]), 2.59 (br s, 6H, H1), 2.22 \text{ (acetone, ref).}\]

**Figure S10.** COSY NMR (500 MHz, D₂O, 298 K, 0.45 mM) of compound CB[8]•T-VPI₂.
**Preparation and NMR spectra of CB[8]_2•VPI-N₂**

A 0.45 mM solution of CB[8]_2•VPI-N₂ was prepared from a mixture of 0.74 mg of solid CB[8] (5.6 × 10⁻⁷ mol, 1.2 equiv.), 115 µL of a 4 mM stock solution of VPI-N (4.6 × 10⁻⁷ mol) in D₂O and 440 µL of D₂O. Acetone was used as internal reference (2.22 ppm).

According to the integral value of signals H5 (8.90 ppm, I = 4.00) and the integral value of CB[8] protons (5.75 ppm, I = 37.82), a CB[8]/VPI-N ratio of 2.36/2 is determined.

^1H NMR (500 MHz, D₂O) δ 8.90 (d, J = 5.9 Hz, 4H, H5), 8.68 (d, J = 6.3 Hz, 4H, H2), 8.39 (d, J = 8.4 Hz, 4H, H6 or H7), 8.32 (d, J = 8.4 Hz, 4H, H6 or H7), 7.19 (s, 4H, H8), 6.91 (br s, 8H, overlapped signals of H9 and H10), 6.82 (d, J = 6.1 Hz, 4H, H4), 6.65 (d, J = 6.2 Hz, 4H, H3), 5.75 (dd, J = 26.9, 15.4 Hz, 32H, CB[8]), 5.49 (s, 32H, CB[8]), 4.60 (s, H1), 4.19 (dd, J = 15.4, 6.3 Hz, 32H, CB[8]), 2.22 (acetone, ref).

*Figure S11.* ^1H NMR spectrum (500 MHz, D₂O, 298 K, 0.45 mM) of compound CB[8]_2•VPI-N₂.
**Figure S12.** COSY NMR (300 MHz, D$_2$O, 298 K, 0.45 mM) of compound CB[8]$_2$•VPI-N$_2$.

**Figure S13.** ROESY NMR (500 MHz, D$_2$O, 298 K, 0.45 mM, mixing time: 400 ms) of compound CB[8]$_2$•VPI-N$_2$. 
12/ Preparation and NMR spectra of T-VPI with CB[10]

A solution of T-VPI with CB[10] was prepared from a mixture of 0.47 mg of solid CB[10] (2.7 × 10^{-7} mol, 1.1 equiv.), 125 µL of a 2 mM stock solution of T-VPI (2.5 × 10^{-7} mol) in D$_2$O and 400 µL of D$_2$O.

$^1$H NMR (500 MHz, D$_2$O, 298 K, Figure S12) $\delta$ 5.8 (br s, CB[10]), 5.5 (br s, CB[10]), 4.1 (br s, CB[10]).

$^1$H NMR (500 MHz, D$_2$O, 340 K, Figure S13) $\delta$ 8.86 (br s), 8.14 (br m), 7.81 (br s), 7.61 (br s), 7.48 – 7.16 (br m), 6.78 (br s), 5.80 (app d, $J = 15.0$ Hz, CB[10]), 5.50 (s, CB[10]), 4.26 – 4.20 (m, CB[10]), 2.35 (br s, H1).

**Figure S14.** $^1$H NMR spectrum (500 MHz, D$_2$O, 298 K, 0.5 mM) of T-VPI with CB[10].

![Diagram with chemical structures and NMR spectra](image)

**Figure S15.** $^1$H NMR spectrum (500 MHz, D$_2$O, 340 K, 0.5 mM) of T-VPI with CB[10].
A 0.17 mM solution of CB[10]₂•VPI-N₃ was prepared from a mixture of 0.46 mg of solid CB[10] (2.8 × 10⁻⁷ mol, 1.0 equiv.), 68 µL of a 4 mM stock solution of VPI-N (2.8 × 10⁻⁷ mol) in D₂O and 500 µL of D₂O. Acetone was used as internal reference (2.22 ppm).

³H NMR (300 MHz, 298 K, D₂O) δ 8.66 (d, J = 6.6 Hz, 4H, H₅a), 8.61 (d, J = 6.4 Hz, 4H, H₂a), 8.45-8.38 (m, 2H, H₅b), 8.23 (d, J = 5.0 Hz, 2H, H₂b), 8.15 (d, J = 8.7 Hz, 4H, H₇a), 8.15-8.06 (m, 40H, CB₁₀), 7.81-7.92 (m, 6H, H₇b and H₆a), 7.49 (d, J = 5.0 Hz, 2H, H₆b), 6.95-7.15 (br m), 6.94-6.80 (br m), 5.78 (app ddd, J = 17.9, 17.0, 10.7 Hz, 40H, CB₁₀), 5.50 (app d, 40H, CB₁₀), 4.53 (br s, H₁a), 4.47 (br s, H₁b), 4.30-4.06 (m, 40H, CB₁₀), 2.22 (acetone, ref). Signals H₃a-b, H₄a-b, H₈a-b, H₉a-b and H₁₀a-b were not identified on the ³H NMR spectrum at 298 K (300 or 500 MHz).

According to the integral value of signals H₅a + H₅b (8.67 ppm, I = 3.78 and 8.33 ppm, I = 1.93) and the integral value of CB₁₀ protons (5.92-5.69 ppm, I = 40.00), a CB₁₀/VPI-N ratio of 2.1/3 is determined.

³H NMR (500 MHz, 340 K, D₂O) δ 8.67 (d, J = 6.3 Hz, 4H, H₅a), 8.52 (d, J = 6.1 Hz, 4H, H₂a), 8.33 (d, J = 5.9 Hz, 2H, H₅b), 8.18 (d, J = 8.4 Hz, 4H, H₂b), 8.14 (d, J = 6.3 Hz, 2H, H₂b), 7.87 (two d, J = 11.6, 8.7 Hz, 6H, overlapped signals of H₇b and H₆a), 7.54 (d, J = 8.4 Hz, 2H, H₆b), 7.08 (d, J = 6.2 Hz, 4H, H₄a), 7.00 (d, J = 6.2 Hz, 4H, H₃a), 6.88 (d, J = 8.5 Hz, 4H, H₉a), 6.79 (d, J = 6.0 Hz, 2H, H₄b), 6.74 (d, J = 6.2 Hz, 2H, H₃b), 6.59 (s, 4H, H₁₀a), 5.92 – 5.69 (m, 40H, CB₁₀), 5.59 – 5.40 (m, 40H, CB₁₀), 4.53 (br s, H₁a), 4.43 (br s, H₁b), 4.18 (app ddd, J = 39.1, 19.6, 11.9 Hz, 40H, CB₁₀), 2.22 (acetone, ref). Signals H₈a, H₈b, H₉b and H₁₀b were not identified on the ³H NMR spectrum at 340 K (500 MHz).

Figure S20. ITC thermogram corresponding to a solution of VPI-N titrated with CB[8] in water.
15/ Competition NMR for the determination of binding constants

The binding constants corresponding to the formation of CB[8]$_2$•T-VPI$_2$ and CB[8]$_2$•VPI-N$_2$ were evaluated using $^1$H NMR in the presence of a competitor guest, following the procedure of Macartney and co-workers,$^{[6]}$ expended to CB[8] 2:2 complexes.$^{[7]}$ The NMR spectra were collected at 298 K on a Bruker AC500 (64 scans) from 1 mM solutions of T-VPI or VPI-N in the presence of 1 equiv. of CB[8] and 1 equiv. of competitor in D$_2$O (Figures S28 to S31). The first competitor guest was 1-adamantylamine•HCl (Ad). The binding constant correspond to formation of the CB[8]•Ad complex ($8.19 \pm (1.75) \times 10^{8}$ M$^{-1}$, R1 and Eq1) was reported in the literature.$^{[8]}$ The chemical shifts of the free Ad and CB[8]•Ad were determined in D$_2$O from 1 mM solutions (Figure S29). The limiting chemical shift values, $\Delta \delta_{\text{lim}}$, for Ad and CB[8]•Ad were measured according to the chemical shifts of CH protons (Table S1). Then, $^1$H NMR spectra of a mixture of T-VPI (1 equiv.), with CB[8] (1 equiv.) and Ad (1 equiv.) were recorded to determine the chemical shifts of CH protons of Ad (Table S2, R3 and Eq3). Chemical resonances for free and complexed Ad suggest fast exchange on the NMR timescale (Figure S29). Following the method of Macartney et al,$^{[6]}$ the binding constant corresponding to the formation of the complex from CB[8] and T-VPI was calculated from the chemical shifts of the competitive spectra and $\Delta \delta_{\text{lim}}$ (Table S1) and considering equation Eq4.

On the other hand, since 1-adamantylamine•HCl (Ad) presents a too low CB[8] binding constant compared to VPI-N, we used memantine (3,5-dimethyladamantylamine•HCl, diMeAd) as competitor to evaluate the binding constant for CB[8]$_2$•VPI-N$_2$ (Figures S30-31). The binding constant of CB[8] toward diMeAd$_2$ is $4.3 \times 10^{11}$ M$^{-1}$.$^{[8]}$ Because the $^1$H NMR signals of free/complexed VPI-N/diMeAd were not clear in the aromatic and aliphatic regions (Figure S30), we evaluated the CB[8]$_2$•VPI-N$_2$ binding constant from the integral values of the CB[8] at 5.540 and 5.490 ppm, assigned to CB[8]•diMeAd and CB[8]$_2$•VPI-N$_2$, respectively (Figure S31). The results are presented in (Table S2).

**Preparation of the Ad/T-VPI/CB[8] competition solution (Figures S28-29):**
A solution of Ad/T-VPI/CB[8] was prepared from a mixture of 0.81 mg of solid CB[8] (6.1 × $10^{-7}$ mol, 1 equiv.), 304 µL of a 2 mM solution of T-VPI (6.1 × $10^{-7}$ mol, 1 equiv.) in D$_2$O, 122 µL of a 5 mM solution of Ad in D$_2$O (6.1 × $10^{-7}$ mol) and 200 µL of D$_2$O. Acetone was used as internal reference (2.22 ppm).

**Preparation of the diMeAd/VPI-N/CB[8] competition solution (Figures S30-31):**
A solution of diMeAd/VPI-N/CB[8] was prepared from a mixture of 0.54 mg of solid CB[8] (4.1 × $10^{-7}$ mol, 1 equiv.), 102 µL of a 4 mM stock solution of VPI-N (4.1 × $10^{-7}$ mol, 1 equiv.) in D$_2$O, 82 µL of a 5 mM solution of diMeAd in D$_2$O (4.1 × $10^{-7}$ mol) and 250 µL of D$_2$O. Acetone was used as internal reference (2.22 ppm).

**Table S1.** $^1$H NMR results considering the Ad/T-VPI competition toward CB[8].

$^a$ Fluorescence quantum yields in deionized water, relative to anthracene in ethanol ($\Phi = 27\%$). Excitation of reference and sample compounds was performed at the same wavelength, i.e. 290 nm for T-VPI and 310 nm for VPI-N and T-V-T.

$^b$ Slightly underestimated value due to the recording conditions.
