## 1. General information

Reagents were purchased at the highest commercial quality grade and used without further purification, unless otherwise stated. Yields refer to chromatographically and spectroscopically ( $^1\text{H}$  NMR) homogeneous material, unless otherwise stated. Reactions were monitored by thin layer chromatography (TLC) carried out on 0.25 mm E. Merck silica plates (60F-254), using UV light (254 nm) and TLC stain with anisaldehyde-sulfuric acid for visualization. Flash chromatography columns were packed with 200-300 mesh silica gel in petroleum (b.p. 60-90 °C).  $^1\text{H}$  and  $^{13}\text{C}$  NMR data were recorded with Bruker (400 MHz) or Jeol (400 MHz) spectrometers with tetramethylsilane as an internal standard. All chemical shifts ( $\delta$  (ppm):) are reported in ppm and coupling constants ( $J$ ) in Hz. All chemical shifts were reported relative to tetramethylsilane (0 ppm for  $^1\text{H}$ ),  $\text{CDCl}_3$  (77.0 ppm for  $^{13}\text{C}$ ). The general preparation methods of all isoquinoline derivatives were synthesized according to the existing literature.<sup>1</sup>

## 2. Electrode materials and dimensions

The instrument for undivided electrolysis is IKA<sup>®</sup> ElectraSyn 2.0 with carousel. The electrodes used in IKA<sup>®</sup> ElectraSyn 2.0 were purchased from IKA Company. The anodic electrode was the carbon plate electrode (3.0 cm  $\times$  0.8 cm  $\times$  0.2 cm) (3.0 cm is the height of the electrode immersed in the solution) and the cathodic electrode was the carbon plate (3.0 cm  $\times$  0.8 cm  $\times$  0.2 cm).

Cyclic voltammograms were recorded on an electrochemical workstation CS150H (CorrTest<sup>®</sup>). A steady glassy carbon disk electrode (3 mm in diameter) was used as the working electrode; a platinum plate was used as the counter electrode; the reference was an Ag/AgNO<sub>3</sub> electrode with (0.01 M) AgNO<sub>3</sub> in N,N-dimethylformamide.

### 3. General procedure for the electrochemical selective oxidation reaction

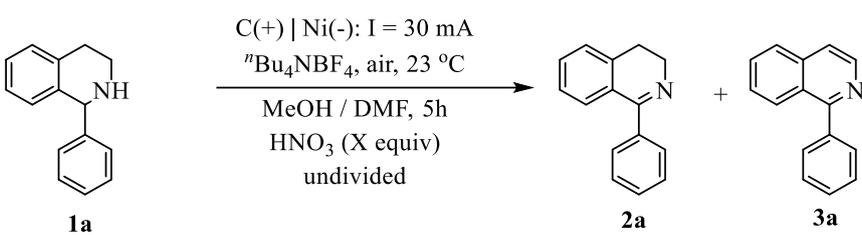

**General procedure A:** The electrolysis was carried out in the electrolysis cell of IKA<sup>®</sup> ElectraSyn 2.0. The anodic electrode was the carbon plate electrode (3.0 cm × 0.8 cm × 0.2 cm) and the cathodic electrode was the carbon plate (3.0 cm × 0.8 cm × 0.2 cm). Isoquinoline derivative (0.5 mmol), <sup>n</sup>Bu<sub>4</sub>NIO<sub>4</sub> (227 mg, 0.5 mmol), concentrated nitric acid (0.75 mmol) and MeOH : DMF = 3 mL:1 mL were added to an oven-dried undivided cell (6 mL) equipped with a stirring bar (the order of the addition did not affect the result). The reaction mixture was stirred and electrolyzed at a constant current of 30 mA at room temperature for 4 h. When the reaction was finished, the solvent was evaporated under vacuum and the crude material was purified by column chromatography or preparative TLC to furnish the desired product.
