# Contents

- 1. Material preparation
- 2. Synthesis of the monomers and polymers
- 3. NMR spectrometry of the compounds
- 4. The thermal stability data of the PBDT-BDT
- 5. References

## **1. Material preparation**

The solvents and reagents used in the experiment were procuremented from TCI and Sigma-Aldrich. Other chemicals used were used directly after purchase without further treatment. Intermediates, monomers and polymer synthesis methods, as well as related information, can be found in the supplementary materials. benzo[1,2-b:4,5-b']dithiophene-4,8-dione (BDT-C=O), benzo[1,2-b:4,5-b']dithiophene-4,8-diol (BDT-OH), benzo[1,2-b:4,5-b']dithiophene-4,8-diol (BDT-OH), benzo[1,2-b:4,5-b']dithiophene-4,8-diol to the report of our research group teacher<sup>[S1]</sup>.

### 2. Synthesis of the monomers and polymers

#### Synthesis of BDT-TBA

The two-necked reaction flask (250 mL) was operated three times with nitrogen anaerobic treatment, and then BDT-OTf (2 g, 4.1 mmol), triphenylamine borate (5.3 g, 12.3 mmol) and the catalyst tetrakis (triphenylphosphine) palladium (0.48 g, 0.41 mmol) was added to the above two-necked reaction flask, then oxygen-free and anhydrous THF (200 mL) and the newly prepared 1M Na<sub>2</sub>CO<sub>3</sub> aqueous solution (100 mL) were added, and the reaction temperature was heated to 85 °C for 24 hours , the reaction was stopped. Then the organic phase was separated with a separatory funnel, removed a small amount of water in the organic phase with anhydrous magnesium sulfate, the upper column sample was concentrated under reduced pressure, which was eluted with CH<sub>2</sub>Cl<sub>2</sub>, the crude product was purified and separated by column chromatography to obtain a light yellow solid product(1.6 g, yield 50%).

#### Synthesis of BDT-TBA-Br

The BDT-TPA (2 g, 2.5 mmol) was put into a low-temperature reaction flask (200 mL), and then it was placed in a vacuum drying oven at 70 °C to dry overnight. Quickly the reaction flask taken out and used nitrogen anaerobic treatment for three times, then the reaction flask was putted into a low-temperature reactor, added THF (80 mL) that has been distilled to remove water, and then cooled to -78 °C, n-butyl lithium solution (2.4 M, 3.1 mL) dropped by drop under nitrogen protection. After two hours of reaction, it was heated up to 0 °C and continued the reaction for half an hour, and then cooled the reaction solution to -78 °C, the carbon tetrabromide (2.5 g, 7.5 mmol) was dissolved in distilled THF (10 mL) and added dropwise. The above reaction flask was heated to 0 °C after half an hour, and the reaction flask was taken out and reacted overnight at room temperature. The reaction was terminated by saturated sodium chloride solution, and then the organic phase was extracted several times with small amount CH2Cl2, and a small amount of water in the combined organic phase was removed with anhydrous magnesium sulfate, and concentrated under reduced pressure to prepare the upper column sample, which was eluted with 20:1(PE:CH<sub>2</sub>Cl<sub>2</sub>). The crude product was purified and separated by column chromatography to obtain a yellow-brown solid product (1.9 g, yield 80%).

The microwave reaction flask was operated three times with nitrogen anaerobic treatment, and then BDT-TPA-Br (0.5 g, 0.52 mmol) and (4,8-bis(5-(2-ethylhexyl)-4-fluorothiophene-2)-yl)benzo[1,2-b:4,5-b']dithiophene-2,6-diyl)bis(trimethylstannane) (0.49 g, 0.52 mmol) were added and tetrakis(triphenyl) Phosphine palladium) (0.06 g, 0.052 mmol), oxygen-free and anhydrous toluene (20 mL) was added to the above reactor, and the temperature was programmed to react at 60 °C for 10 min, 80 °C for 10 min, and 100 °C for 10 min, react at 120 °C for 30 min, the reaction was stopped in the reaction flask , taken out then cooled down and concentrated under reduced pressure, poured into methanol to settle and filtered to obtain a solid. After drying, the sample was put into a Soxhlet extractor, and then extracted with n-hexane and acetone successively. The reflux liquid was washed until colorless and extracted again with CHCl<sub>3</sub> as a solvent. reduced pressure concentrate until there was a small amount of solvent, then settled with a large amount of methanol, and obtained a red solid product after filtration (0.6 g, yield 91%).

# 3. NMR spectrometry of the compounds

**Fig. S1.** <sup>1</sup>H-NMR of 4,4'-(benzo[1,2-b:4,5-b']dithiophene-4,8-diyl)bis(N,N-bis(4-methoxyphenyl)aniline) (BDT-TBA).
