## 1. Materials

Raw materials involved in this work include phenol (AR, 99%), formaldehyde (AR, 37 wt%), sodium hydroxide (AR 96%), pluronic F-127, Zinc nitrate hexahydrate (AR, 98%), copper (II) nitrate hexahydrate (AR, 99%), nickel (II) nitrate hexahydrate (AR, 98%), 2-methylimidazole, hydrochloric acid, ethyl alcohol, isopropanol. The Nafion (5%) was purchased from Aladdin, and carbon paper was obtained from Hesen (HCP135), respectively. All reagents were used as received.

## 2. Methods

Electrochemical measurements were performed on a CHI 760E electrochemical workstation (ShangHai, China) with a three-electrode system in typical H-Cell (GaossUnion, TianJin) / Flow cell (self-assembly) separated by Nafion\*117 (Dupond) membrane between cathode and anode. Gas phase products were analyzed by Gas Chromatography (SHIMADZU GC2014). Liquid product was detected by nuclear magnetic resonance spectrometer (<sup>1</sup>HNMR) on ECZ600R. Microstructure images were taken using field emission scanning electron microscope (SEM, SU-8010). High-resolution TEM images as well as element mapping were obtained using transmission electron microscope (TEM, Tecnai F20). The raman spectrums were performed on a Renishaw InVia Raman Microscope (532). X-ray diffraction spectra were taken by a Rigaku Miniflex 600 powder diffractometer. X-ray photoelectron spectra were carried out using ESCALAB 250Xi. The metal content was measured by Inductive Coupled Plasma Emission Spectrometer (Ultima 2).

### 2.1 Preparation of Resol-F127 solution.

The Resol-F127 solution was prepared undergoing the following steps: 0.6 g phenol, formaldehyde solution (2.1 mL, 37 wt% in H<sub>2</sub>O), and an aqueous NaOH solution (15 mL, 0.1 M) were mixed and stirred at 70 °C for 30 min in a three-necked flask to obtain low-molecular-weight phenolic resols. Then, 65 mL aqueous solution containing 0.96 g F-127 was added and keep stirring under 340 rpm at 65 °C for further 15 h.

### 2.2 Preparation of CuNi-ZIF-8 suspension.

Typically, CuNi-ZIF-8 suspension liquid were synthesized using a one-step method in aqueous solution at room temperature. First, 0.8925 g Zn(NO<sub>3</sub>)<sub>2</sub>·6H<sub>2</sub>O, 0.0363 g Cu(NO<sub>3</sub>)<sub>2</sub>·3H<sub>2</sub>O and 0.0436 g Ni(NO<sub>3</sub>)<sub>2</sub>·6H<sub>2</sub>O were dissolved in 25 mL DI water via vigorously stirring to get a homogenous solution A. 1.2 g 2-methylimidazole was dissolved in 25 mL DI water to prepare solution B. Subsequently, poured solution A to solution B, and kept the reaction under ultrasonic processing for 1 h.

### 2.3 Preparation of Resol-F127 @ CuNi-ZIF-8 Composite.

24mL CuNi-ZIF-8 suspension, 8 mL Resol-F127 solution were thoroughly mixed by stirring for 30 min. Then the mixed suspension was transferred to a Teflon-lined autoclave for reaction at 150 °C for 20 h at a heating rate of 4 °C min<sup>-1</sup> to reaction temperature. Following completion of the reaction, the autoclave was allowed to cool down to room temperature. After centrifugation and washed by water, the product was dried in a lyophilizer for 24 h to obtain Resol-F127 @ CuNi-ZIF-8 composite.

### 2.4 Synthesis of CuNi-N-CNS

A freshly prepared resol-F127 @ CuNi-ZIF-8 composite was transferred to a tube furnace and carbonized under a Ar atmosphere at 350 °C for 1 h, then at 900 °C for 2 h with a heating rate of 3 °C min<sup>-1</sup>. After cooling to room temperature, the powder obtained was immersed in 2 M hydrochloric acid for 2 h to remove unstable metal impurities. The CuNi-N-CNS was then obtained after centrifugation, washing and drying.

### 2.5 Synthesis of contrast samples

The controlled samples, *i. e.* Ni-N-CNS, Cu-N-CNS and N-CNS, were prepared by the similar method with that of CuNi-N-CNS apart from without addition of Cu salt, Ni salt, and metal salts, respectively.

## 3. CO<sub>2</sub>RR performance evaluation

### 3.1 H-type cell

Electrolysis was performed in a gas-tight H-type electrolyzer separating by a cation exchange membrane (Nafion 117). The Ag|AgCl electrode, platinum mesh (1\*1 cm<sup>2</sup>) and carbon paper (1\*1 cm<sup>2</sup>) acted as the reference electrode, counter electrode and work electrode, respectively. The work electrode was fabricated as the following processes: 100 μL of the catalyst ink was drop-casted on carbon paper electrode to achieve an approximately 1mg cm<sup>-2</sup> loading amount and then dried under an infrared light. And 0.5 M KHCO<sub>3</sub> aqueous solution was used as the electrolyte, and the electrolyte was bubbled with CO<sub>2</sub> at least 20 min with a flow rate of 20 mL min<sup>-1</sup> before electrolysis, the pH of the CO<sub>2</sub> saturated 0.5 M KHCO<sub>3</sub> was about 7.25. Then 1mL of gas was injected into gas chromatography from the outlet to analyze the composition of gas phase products. The detectors are calibrated by two different concentrations (H<sub>2</sub>: 99.3 ppm and 10000 ppm; CO: 99.3 ppm and 10000 ppm) of standard gases.

### 3.2 Flow cell

Self-assembly flow cell was used to achieve great CO<sub>2</sub>RR performance at high current densities. The device generally included a cathode chamber, an anode chamber and a proton exchange membrane (see Fig. 4a and supplementary Fig. S19). A commercial RuIrTi mesh is used as anode and an Ag|AgCl is acted as the reference. 3 M KCl and 1 M KOH are used as the cathode and anode electrolyte, respectively. The cathode chamber and anode chamber is separated by a piece of Nafion 117 membrane. Electrolytes are cycled at 100 mL min<sup>-1</sup> and the CO<sub>2</sub> gas is supplied at rate of 20 mL min<sup>-1</sup>. The pH of CO<sub>2</sub> saturated 3 M KCl presents a mildly acid environment with pH 4.25.

### 4. Electrochemical measurement in three-electrode system

All the potentials were quoted with respect to reversible hydrogen electrode (RHE) through RHE calibration according to the formula:

$$E (\text{vs. RHE}) = E (\text{vs. Ag|AgCl}) + E^{\square} (\text{Ag|AgCl}) + 0.059 \times \text{pH}$$

$$E (\text{vs. RHE}) = E (\text{vs. Ag|AgCl}) + 0.197 \text{ V} + 0.059 \times \text{pH} \quad (\text{Eq. 1})$$

The faradaic efficiency of gas product was calculated based on the following equation (Eq. 2):

$$FE = \frac{Q}{Q_{\text{total}}} = \frac{n z F}{RT} \times \frac{P V_x}{\int i dt} \quad (\text{Eq. 2})$$

Where z is the number of electrons transferred per mole of gas products, n is the amount of substance of product, F is Faradaic constant 96485 C/mol, Q and  $\int i dt$  are total passed charge within time t. And t is the time that needs to fill the sample injector at a constant CO<sub>2</sub> gas flow rate, V<sub>x</sub> is the volume fraction of the obtained gaseous product i with time t (s), P is atmospheric pressure (1.01\*10<sup>5</sup> Pa), T is the temperature, R is the gas constant (8.314 J mol<sup>-1</sup> K<sup>-1</sup>).

The partial current density of j<sub>CO</sub> was calculated as following equation (Eq. 3)

$$j_{CO} = FE(CO) \times \frac{\int i dt}{t} \quad (\text{Eq. 3})$$

The turn over frequency (TOF, h<sup>-1</sup>) was calculated as following equation (Eq. 4)

$$TOF = \frac{j_{CO} * A / zF}{m_{cat}^w / M} \times 3600 \quad (\text{Eq. 4})$$

A: the surface area of the electrode (1 cm<sup>2</sup>)

z: the number of electron transferred for CO production

j<sub>CO</sub>: the partial current density (mA cm<sup>-2</sup>)

F: Faradaic constant 96485 C/mol

$m_{\text{cat}}$ : the mass loading on the work electrode (mg)

W: Ni or Cu weight loading in the catalyst based on the ICP results.

The liquid products from were detected by H1NMR. 500  $\mu\text{L}$  electrolyte after electrolysis was mixed with 100  $\mu\text{L}$   $\text{D}_2\text{O}$  containing 0.3  $\mu\text{L}$  DMSO.

**Table S1.** ICP-OES results of CuNi-N-CNS.

Elements	Cu	Ni
Wt%	2.60%	2.39%

**Table S2.** The E- $\text{CO}_2$ RR performance of recent reported catalysts.

Catalysts	Electrolyte	Electrolyzer	Long-term test	Potential	Current density	FE( $\text{CO}$ )	Reference
Ni/Cu-N-C	0.5 M $\text{KHCO}_3$	H-Cell	60 h	-0.79 V vs. RHE	-30 $\text{mA cm}^{-2}$	99.2%	[1]
Ni/Fe-N-C	0.5 M $\text{KHCO}_3$	H-Cell	30 h	-0.7 V vs. RHE	-7.4 $\text{mA cm}^{-2}$	98.0%	[2]
NiSA/PCFM	0.5 M $\text{KHCO}_3$	H-Cell	15 h	-1.0 V vs. RHE	-28 $\text{mA cm}^{-2}$	87.0%	[3]
Ni-N-CNS/CNT	1 M KOH	Flow Cell	26 h	-0.73 V to -1.1 V	-100 $\text{mA cm}^{-2}$ (constant current)	98.3%	[4]
Ni- $\text{N}_4$ /C- $\text{NH}_2$	0.5 M $\text{KHCO}_3$	H-Cell	10 h	-0.8 V vs. RHE	-50 $\text{mA cm}^{-2}$	90.0%	[5]
Ni-N-MEGO	0.5 M $\text{KHCO}_3$	H-Cell	21 h	-0.55 V vs. RHE	-13.7 $\text{mA cm}^{-2}$	89.0%	[6]
Ni-NG	0.5 M $\text{KHCO}_3$	H-Cell	20 h	-0.64 V vs. RHE	-11 $\text{mA cm}^{-2}$	85.0%	[7]
Ni-NG	0.1 M $\text{KHCO}_3$	Flow Cell	8 h	2.78 V (cell voltage)	50 $\text{mA cm}^{-2}$	90.0%	[7]
Ni/HMCS-3-800	0.5 M $\text{KHCO}_3$	H-Cell	10 h	-0.9 V vs. RHE	6 $\text{mA cm}^{-2}$	90.0%	[8]
CuNi-N-CNS	0.5 M $\text{KHCO}_3$	H-Cell	50 h	-0.74 V vs. RHE	15 $\text{mA cm}^{-2}$ to 10 $\text{mA cm}^{-2}$	~95.0%	This work
CuNi-N-CNS	3 M KCl	Flow cell	20 h	-0.82 V vs. RHE	200 $\text{mA cm}^{-2}$ to 100 $\text{mA cm}^{-2}$	99% to 90%	This work
