Experimental Section

Materials and Instruments: Unless otherwise stated, all reagents used in this work were reagent grades and purchased from commercial sources without further purification. Deionized water was used throughout the whole experiments. Tris[4-(1H-imidazol-1-yl)-phenyl]amine, methotrexate, methanol, adenosine 5'-monophosphate, urea, glucose, sodium bicarbonate, sodium chloride, potassium chloride, calcium chloride, magnesium chloride, histidine, serine, leucine, lysine, proline, cysteine, phenylalanine, ethylene glycol, polyvinyl alcohol and goat serum were procured from Sigma-Aldrich.

The powder X-ray diffraction (PXRD) patterns were recorded on Bruker D8 ADVANCE diffractometer employing Cu K α radiation (40 mA and 40 kV). Fourier transform infrared (FT-IR) spectra were obtained by a Nexus 912 AO446 infrared spectrum radiometer in the wavenumber range of 4000 – 400 cm⁻¹. Thermogravimetric (TG) curves were measured on a TA TGA 55 system operating at a heating rate of 10 °C/min in the range of 25 °C up to 800 °C under N² atmosphere. The Automated Surface Area and Porosity Analyzer (BET) figure was obtained by Micromeritics ASAP 2460. The Commission International de l'Eclairage (CIE) coordinate were calculated by CIE1931 Chromaticity Coordinate Calculation according to the fluorescence emission spectra. The UV-vis absorption spectra were carried on an Agilent 8453 spectrometer. The photos of application in information encryption and decryption were collected by Ultraviolet Analyzer ZF-I and the power of the UV lamp was 6 W. The pH values of aqueous solutions were determined by an INESA PHS-25 pH meter with an E-201F pH composite electrode, which was carefully calibrated by standard buffer solution before testing. The water solution with various pH values was prepared by adding different content of HCl and NaOH in deionized water. The HOMO-LUMO energy levels were optimized by the B3LYP hybrid density functional and the basis set was 6-31G(d).

Fig. S1 The 3-dimensional framework of HOF-TIA along the a axis. The molecular stacking modes of adjacent layers are opposite.

Fig. S2 Schematic diagram of TIA molecular crossover of different arrangements in HOF-TIA framework.

Table S1 The crystallographic data of **HOF-TIA**.

Crystal data	HOF-TIA
CCDC number	2221028
Crystal system	monoclinic
Space group	<i>P2₁/c</i>
Molecular formula	C ₂₇ H ₂₁ N ₇ O ₃
Formula weight	497.55
<i>a</i> / Å	9.998(5)
<i>b</i> / Å	22.169(11)
<i>c</i> / Å	11.873(7)
α /°	90
β /°	113.267(2)
γ /°	90
Volume/ Å ³	2417.7(2)
<i>Z</i>	4
Density/ g/cm ³	1.36685
GOF on F2	1.019
R1a[<i>I</i> >2σ(<i>I</i>)]	0.0515
ωR2b[<i>I</i> >2σ(<i>I</i>)]	0.1343

Table S2 The bond angle and distance between two atoms for hydrogen bonds in HOF-TIA.

hydrogen bonds	bond angle	atoms	distance
O3-H3...O1	173.64	O3-O1	2.8174
O1-H1...N1	172.25	O1-N1	2.8045
O2-H3...C3	154.94	O2-C3	3.3715

The angle between plane 1 (purple) and plane 2 (green) is 5.154 °, the angle between plane 1 (purple) and plane 3 (yellow) is 64.635 °, the angle between plane 2 (green) and plane 3 (yellow) is 69.865 °. Plane 1: N1, C1, C2, N2 and C3 atoms; Plane 2: N3, C26, C17, N4 and C18 atoms; Plane 3: N5, C25, C26, N6 and C27 atoms.

Table S3 Summary of the methods for sensing MTX.

Method	Linear range (μM)	DL (μM)	Ref.
Electrochemical	0.70–100	0.070	[R _{S1}]
Electrochemical	2.2–25	0.090	[R _{S2}]
Fluorescence	0–0.5	0.0605	[R _{S3}]
Fluorescence	0.1–2	0.030	[R _{S4}]
Fluorescence	0.05–1	0.042	[R _{S5}]
SERS	0–80	2.36	[R _{S6}]
SERS	0.2–2	0.17	[R _{S7}]
