## 1. General characterization

${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectra were measured on a Bruker Avance-400 spectrometer. Absorption spectra were recorded on a Shimadzu UV-1800 spectrophotometer. Cyclic voltammetry was done by using a Shanghai Chenhua CHI620D voltammetric analyzer under argon in an anhydrous acetonitrile solution of tetra-n-butylammonium hexafluorophosphate ( 0.1 M ). A glassy-carbon electrode was used as the working electrode, a platinum-wire was used as the counter electrode, and a $\mathrm{Ag} / \mathrm{Ag}^{+}$electrode was used as the reference electrode. Acceptors were coated onto glassy-carbon electrode and all potentials were corrected against $\mathrm{Fc} / \mathrm{Fc}^{+}$. AFM was performed on a Multimode microscope (Bruker-M8-HR) by using tapping mode. Single-crystal X-ray diffraction data of MC8-4H was collected on a Bruker D8 VENTURE diffractometer.

## 2. Synthesis

All reagents were purchased from J\&K Co., Aladdin Co., Innochem Co., and other commercial suppliers. Tributyl(6-undecylthieno[3,2-b]thiophene-2-yl)stannane was synthesized according to literature. ${ }^{[1]}$ All reactions dealing with air- or moisture-sensitive compounds were carried out by using standard Schlenk techniques.

Compound 1. To a mixture of 2,5 -dibromoterephthalaldehyde ( $782 \mathrm{mg}, 2.68 \mathrm{mmol}$ ), tributyl(6-undecylthieno[3,2-b]thiophene-2-yl)stannane ( $3.9 \mathrm{~g}, 6.68 \mathrm{mmol}$ ) and $\mathrm{Pd}\left(\mathrm{PPh}_{3}\right)_{4}(310$ $\mathrm{mg}, 0.27 \mathrm{mmol}$ ) was added DMF ( 8 mL ) under $\mathrm{N}_{2}$. The mixture was heated to $130^{\circ} \mathrm{C}$ and stirred for 1 h . After cooling to room temperature, the reaction mixture was poured into methanol and filtered. The residue was washed with methanol to give compound $\mathbf{1}$ as a yellow solid ( $1.84 \mathrm{~g}, 95 \%) .{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 400 \mathrm{MHz}, \delta / \mathrm{ppm}\right): 10.34(\mathrm{~s}, 2 \mathrm{H}), 8.22(\mathrm{~s}, 2 \mathrm{H}), 7.30(\mathrm{~s}$,

MALDI-TOF MS (m/z): $\mathrm{C}_{42} \mathrm{H}_{54} \mathrm{O}_{2} \mathrm{~S}_{4}\left(\mathrm{M}^{+}\right)$calc. 718.3, found 718.3.

Compound 2. To compound 1 ( $278 \mathrm{mg}, 0.387 \mathrm{mmol}$ ) was added phenylmagnesium bromide ( $3.9 \mathrm{~mL}, 1.0 \mathrm{M}$ in THF) under $\mathrm{N}_{2}$. After stirring for 0.5 h , the reaction mixture was poured into water and extracted with petroleum ether (PE). After removal of the solvent, the crude product was purified via column chromatography (silica gel) by using $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ as eluent to afford the phenylation intermediate as a yellow solid. Then, to a mixture of the above solid ( 282 mg ) and Amberlyst $15(250 \mathrm{mg})$ was added dry toluene $(100 \mathrm{~mL})$. The mixture was stirred at room temperature for 1.5 h . The mixture was purified via flash column chromatography (silica gel) by using hot $\mathrm{CHCl}_{3}$ as eluent to give compound 2 as a yellow solid ( $270 \mathrm{mg}, 83 \%$ ). ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 400 \mathrm{MHz}, \delta / \mathrm{ppm}\right): 7.41(\mathrm{~s}, 2 \mathrm{H}), 7.36-7.28(\mathrm{~m}, 6 \mathrm{H}), 7.25-7.22(\mathrm{~m}, 4 \mathrm{H}), 6.85(\mathrm{~s}, 2 \mathrm{H})$, $5.02(\mathrm{~s}, 2 \mathrm{H}), 2.71(\mathrm{t}, J=7.4 \mathrm{~Hz}, 4 \mathrm{H}), 1.80-1.69(\mathrm{~m}, 4 \mathrm{H}), 1.34-1.26(\mathrm{~m}, 32 \mathrm{H}), 0.87(\mathrm{t}, J=6.6$ $\mathrm{Hz}, 6 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR data was not acquired due to the low solubility of compound 2. MALDITOF MS (m/z): $\mathrm{C}_{54} \mathrm{H}_{62} \mathrm{~S}_{4}\left(\mathrm{M}^{+}\right)$calc. 838.4, found 838.4.

MC8-CHO. To a mixture of compound $2(258 \mathrm{mg}, 0.31 \mathrm{mmol})$ and t-BuONa ( $118 \mathrm{mg}, 1.23$ mmol ) was added dry DMSO ( 86 mL ) under $\mathrm{N}_{2}$. After stirring for additional 40 minutes, 1,8 diiodooctane ( $72 \mu \mathrm{~L}, 0.372 \mathrm{mmol}$ ) was added. The solution was heated to $80^{\circ} \mathrm{C}$ and stirred for 10 minutes. After cooling to room temperature, the reaction mixture was poured into water and extracted with PE. After removal of the solvent, the mixture was purified via flash column chromatography (silica gel) by using $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ as eluent to give macrocyclic intermediate MC8 as a green oil. MC8 is not stable under air. To avoid decomposition, the MC8 was quickly mixed with anhydrous DMF $(0.1 \mathrm{~mL}), \mathrm{POCl}_{3}(0.1 \mathrm{~mL})$ and dichloroethane $(4.0 \mathrm{~mL})$ at $0{ }^{\circ} \mathrm{C}$ under $\mathrm{N}_{2}$. After stirring at room temperature for 10 minutes, the mixture was heated to $80^{\circ} \mathrm{C}$ and stirred overnight. Then, the solution was cooled to $0{ }^{\circ} \mathrm{C}$, quenched with saturated $\mathrm{CH}_{3} \mathrm{COOK}(\mathrm{aq})$ and extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$. After removal of the solvent, the crude product was purified via column chromatography (silica gel) by using $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ : PE (1:1) as eluent to give MC8-CHO as a yellow sticky solid ( $65 \mathrm{mg}, 21 \%$ ). ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 400 \mathrm{MHz}, \delta / \mathrm{ppm}\right): 10.02$ $(\mathrm{s}, 2 \mathrm{H}), 7.48-7.27(\mathrm{~m}, 12 \mathrm{H}), 3.13-3.06(\mathrm{~m}, 4 \mathrm{H}), 2.88-2.83(\mathrm{~m}, 2 \mathrm{H}), 2.47-2.41(\mathrm{~m}, 2 \mathrm{H}), 1.87-$ $1.80(\mathrm{~m}, 4 \mathrm{H}), 1.45-1.26(\mathrm{~m}, 32 \mathrm{H}), 1.13-1.04(\mathrm{~m}, 4 \mathrm{H}), 0.88(\mathrm{t}, J=6.8 \mathrm{~Hz}, 6 \mathrm{H}), 0.83-0.77(\mathrm{~m}$, $2 \mathrm{H}), 0.48-0.47(\mathrm{~m}, 2 \mathrm{H}), 0.33-0.31(\mathrm{~m}, 2 \mathrm{H}), 0.24-0.11(\mathrm{~m}, 2 \mathrm{H}){ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 100 \mathrm{MHz}\right.$, $\delta / \mathrm{ppm}): 181.86,155.03,148.94,146.84,146.01,143.71,140.99,138.25,138.17,137.58$, 128.97, 127.49, 126.47, 117.20, 57.75, 35.35, 31.87, 30.24, 29.58, 29.56, 29.45, 29.29, 28.45, 28.26, 28.13, 25.24, 22.66, 14.10. ## 6. Device fabrication and measurements

## Conventional solar cells

A 30 nm thick PEDOT:PSS (CLEVIOSTM P VP Al 4083 from Heraeus) layer was made by spin-coating an aqueous dispersion onto ITO glass ( 4000 rpm for 25 s ). PEDOT:PSS substrates were dried at $150{ }^{\circ} \mathrm{C}$ for 15 min . An active blend solution (L4:acceptor in CF) was spin-coated onto PEDOT:PSS. PDIN (Organtec Co) $(2 \mathrm{mg} / \mathrm{mL})$ in $\mathrm{MeOH}: \mathrm{AcOH}(1000: 3)$ was spin-coated onto active layer ( 5000 rpm for 30 s ). $\mathrm{Ag}(\sim 80 \mathrm{~nm})$ was evaporated onto PDIN through a shadow mask (pressure ca. $10^{-4} \mathrm{~Pa}$ ). The effective area for the devices is $4 \mathrm{~mm}^{2}$. The thicknesses of the active layers were measured by using a KLA Tencor D-120 profilometer. $J-V$ curves were measured by using a computerized Keithley 2400 SourceMeter and a Xenon-lamp-based solar simulator (Enli Tech, AM $1.5 \mathrm{G}, 100 \mathrm{~mW} / \mathrm{cm}^{2}$ ). The illumination intensity of solar simulator was determined by using a monocrystalline silicon solar cell (Enli SRC2020, $2 \mathrm{~cm} \times 2 \mathrm{~cm}$ ) calibrated by the National Institute of Metrology (NIM). The external quantum efficiency (EQE) spectra were measured by using a QE-R3011 measurement system (Enli Tech).

## Hole-only devices

An active blend in CF was spin-coated onto PEDOT:PSS layer. Finally, $\mathrm{MoO}_{3}(\sim 6 \mathrm{~nm})$ and $\mathrm{Al}(\sim 100 \mathrm{~nm})$ was successively evaporated onto the active layer through a shadow mask (pressure ca. $10^{-4} \mathrm{~Pa}$ ). $J$ - $V$ curves were measured by using a computerized Keithley 2400 SourceMeter in the dark.

## Electron-only devices

The structure for electron-only devices is $\mathrm{ITO} / \mathrm{ZnO} /$ active layer/PDIN/Al. The ZnO precursor solution was spin-coated onto ITO glass ( 4000 rpm for 30 s ). The films were annealed at 200 ${ }^{\circ} \mathrm{C}$ in air for 20 min . Pure acceptor or an active blend in CF was spin-coated onto ZnO . $\mathrm{Al}(\sim 100$ nm ) was successively evaporated onto the active layer through a shadow mask (pressure ca. $10^{-4} \mathrm{~Pa}$ ). $J-V$ curves were measured by using a computerized Keithley 2400 SourceMeter in the dark.

## 10. Surface free energy measurements

The experiments were performed on a KRUSS DSA100S contact angle goniometer. Droplets of two different liquids, water and ethylene glycol (EG) were cast onto the films with the drop size of $2 \mu \mathrm{~L}$. Contact angle images were taken at 1 s after the whole droplet was deposited onto the sample surface. The surface free energy of each sample was calculated by:

$$
\begin{aligned}
& \gamma_{\text {water }}\left(\cos \theta_{\text {water }}+1\right)=2\left(\gamma_{\text {sample }}{ }^{\mathrm{d}} \times \gamma_{\text {water }}{ }^{\mathrm{d}}\right)^{1 / 2}+2\left(\gamma_{\text {sample }} \times \gamma_{\text {water }}{ }^{\mathrm{p}}\right)^{1 / 2} \\
& \gamma_{\mathrm{EG}}\left(\cos \theta_{\mathrm{EG}}+1\right)=2\left(\gamma_{\text {sample }} \times \gamma_{\text {EG }}{ }^{\mathrm{d}}\right)^{1 / 2}+2\left(\gamma_{\text {sample }^{\mathrm{p}} \times \gamma_{\mathrm{EG}} \mathrm{p}}\right)^{1 / 2} \\
& \gamma_{\text {sample }}{ }^{\text {toal }}=\gamma_{\text {sample }}{ }^{\mathrm{d}}+\gamma_{\text {sample }}{ }^{\mathrm{p}}
\end{aligned}
$$

where $\theta$ is the droplet contact angle on the sample film; $\gamma_{\text {sample }}{ }^{\text {total }}$ is the surface free energy of the sample, which is equal to the sum of the dispersion ( $\gamma_{\text {sample }}{ }^{\mathrm{d}}$ ) and polarity ( $\gamma_{\text {sample }}{ }^{\mathrm{p}}$ ) components; $\gamma_{\text {water }}=72.8 \mathrm{~mJ} / \mathrm{m}^{2}, \gamma_{\text {water }}{ }^{\mathrm{d}}=21.8 \mathrm{~mJ} / \mathrm{m}^{2}, \gamma_{\text {water }}{ }^{\mathrm{p}}=51.0 \mathrm{~mJ} / \mathrm{m}^{2}, \gamma_{\mathrm{EG}}=48.0 \mathrm{~mJ} / \mathrm{m}^{2}$, $\gamma_{\mathrm{EG}}{ }^{\mathrm{d}}=29.0 \mathrm{~mJ} / \mathrm{m}^{2}, \gamma_{\mathrm{EG}}{ }^{\mathrm{p}}=19.0 \mathrm{~mJ} / \mathrm{m}^{2}$. ${ }^{[2,3]}$
