General information

Chromatography: HaiLang Silica Flash P60 size 40~63 μm (200~300 mesh), TLC: HaiLang silica gel 60 (0.25mm). Visualization of the chromatogram was performed by UV, phosphomolybdic acid and KMnO₄ staining. Mass spectra were recorded on Bruker UltiMate3000 & Compact, Thermo ISQ LT, LTQ XL and VELOS pro & ORBITRIP mass spectrometers. ¹H, ¹³C, ¹⁹F were recorded on Bruker 500 using CDCl₃ or DMSO-d6 as solvent. Chemical shift values are reported in ppm with the solvent resonance as the internal standard (CDCl₃: δ 7.26 for ¹H, δ 77.16 for ¹³C). Data are reported as follows: chemical shifts, multiplicity (s = singlet, bs = broad singlet, d = doublet, dd = doublet of doublets, t = triplet, td = triplet of doublets, m = multiplet), coupling constants (Hz), and integration. If no special description, all reactions were conducted under air atmosphere. Starting materials were purchased from adamas and used without further purification.

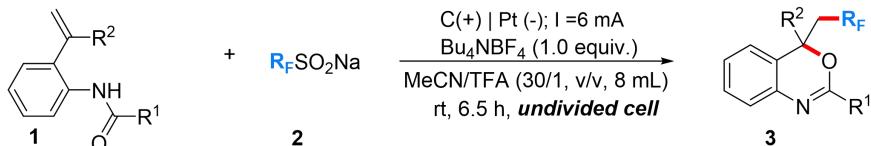

General procedure for preparation of N-acyl-(2-ene)-anilines

N-acyl-(2-ene)-anilines in the reactions were prepared with revised protocol according to the reported methods ^[1,2].

To a solution of methyltriphenylphosphonium bromide (5.36 g, 15.0 mmol) in dry THF (20.0 mL) under N₂ atmosphere was added t-BuOK (1.68 g, 15.0 mmol) at 0 °C. The reaction medium was allowed to RT and stir for 0.5 h. 2-aminoacetophenone (1.35 g, 10.0 mmol) was dropwise added. The reaction medium was stirred at room temperature for 12 h. Upon completion of ketone, monitored by TLC, the medium was poured into hexane, stirred for 1.0 h, plugged through a silica pad. The filtrate was concentrated under reduced pressure, the crude product was purified with column chromatography on silica gel (200~300 mesh) and PE to PE/EA (20/1, v/v) as eluent to afford corresponding styrene. To a solution of styrene (0.99 g, 7.4 mmol) and Et₃N (1.53 g, 11.1 mmol) in DCM (15.00 mL) was dropwise added the solution of acyl chloride (8.90 mmol) in dichloromethane (5.00 mL) at 0 °C. After completion, the reaction mixture was purified via column chromatography to give **1a**.

General procedure for the synthesis of difluoromethylated benzoxazines

In an undivided flask (4 mL) equipped with a stir bar, N-acyl-(2-ene)-anilines **1** (0.3 mmol), Sodium fluoromethylsulfonate **2** (0.6 mmol), Bu₄NBF₄ (0.3 mmol), MeCN/TFA (30/1, v/v, 8 mL) were added.

The flask was equipped with platinum cathode (20 mm × 10 mm × 0.1 mm) and graphite plate anode (20 mm × 10 mm × 0.1 mm). The reaction medium was stirred and electrolyzed at a constant current of 6 mA under RT for 6.5 h. After completion, the solvent was concentrated under reduced pressure, and the pure products **3** were obtained by flash chromatography on silica gel.
