## A. General Information

All purchased reagents and solvents were used without further purification unless otherwise noted. Analytical thin layer chromatography was performed by using commercially prepared 100-400 mesh silica gel plates ( $GF_{254}$ ) and visualization was effected at 254 nm. All the 2,2'-(ethyne-1,2-diyl)dianilines were prepared according to known procedures.  $^1H$  and  $^{13}C$  NMR spectra were recorded using a Bruker DRX-400 spectrometer using  $CDCl_3$  as solvent. The chemical shifts are referenced to signals at 7.26 and 77.0 ppm, respectively. Mass spectra were recorded on a Thermo Scientific ISQ gas chromatograph-mass spectrometer. The data of HRMS was carried out on a high-resolution mass spectrometer (LCMS-IT-TOF). IR spectra were obtained either as potassium bromide pellets or as liquid films between two potassium bromide pellets with a Bruker TENSOR 27 spectrometer. Melting points were determined with a Büchi Melting Point B-545 instrument.

### C. General Procedure for the Synthesis of Starting Materials

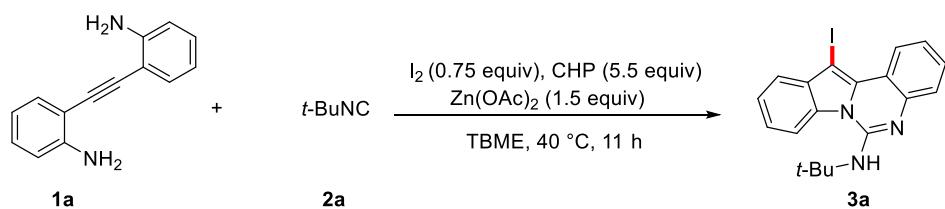

Unless otherwise specified, functionalized alkynes were synthesized *via* the following steps:

Step 1: To an oven-dried round bottom flask containing a magnetic stir bar was added aryl halide (1.0 equiv),  $\text{Pd}(\text{PPh}_3)_2\text{Cl}_2$  (0.5 mol %), and  $\text{CuI}$  (1 mol %). The vessel was then sealed with a rubber septum, evacuated, and backfilled with argon three times.  $\text{Et}_3\text{N}$  (solvent,  $c = 0.5 \text{ M}$ ) and trimethylsilylacetylene (1.5 equiv) were added in sequence. After the reaction was completed at room temperature (monitored by TLC), solvent was removed under reduced pressure and the resulting residue was directly purified by flash column chromatography (eluent: hexanes/EtOAc) on silica gel. To the crude product (1.0 equiv) in MeOH (solvent,  $c = 0.2 \text{ M}$ ) was added  $\text{K}_2\text{CO}_3$  (2.0 equiv) in one portion. After the reaction was completed at room temperature (monitored by TLC), the resulting mixture was filtered through a short pad of silica gel and washed with petroleum ether. The filtrate was concentrated under reduced pressure to afford product **S1** which was directly used for next step without further purification.

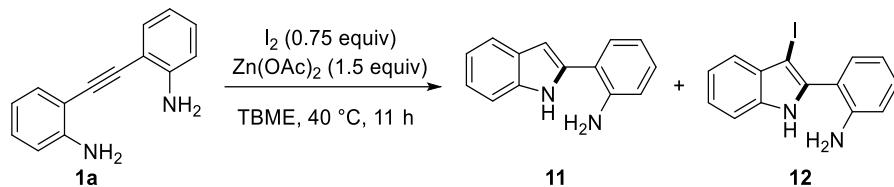

Step 2: To an oven-dried round bottom flask containing a magnetic stir bar was added the aryl halide (1.0 equiv),  $\text{Pd}(\text{PPh}_3)_2\text{Cl}_2$  (0.5 mol %), and  $\text{CuI}$  (1 mol %). The vessel was then sealed with a rubber septum, evacuated, and backfilled with argon three times.  $\text{Et}_3\text{N}$  (solvent,  $c = 0.5 \text{ M}$ ) and **S1** (1.2 equiv) were added in sequence. After the reaction was completed at 90 °C overnight, solvent was removed under reduced pressure and the resulting residue was directly purified by flash column chromatography (eluent: hexanes/EtOAc = 5:1-10:1) on silica gel to give the final product **1** (yields: 25-80%).
