1. General methods and materials

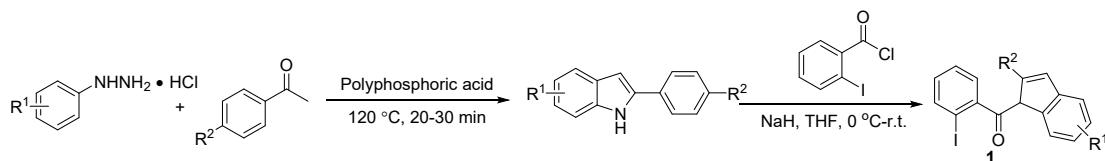

All reactions involving air- and moisture-sensitive reagents were carried out under an argon atmosphere. ^1H and ^{13}C NMR spectra were recorded on a Bruker AC-P 400 spectrometer (400 MHz for ^1H , 100 MHz for ^{13}C) in CDCl_3 (with TMS as internal standard). Chemical shifts (δ) were measured in ppm. Coupling constants, J , are reported in hertz. Mass data were measured with Thermo Scientific DSQ II mass spectrometer and Bruker O-TOF Compact Mass Spectrometry. Melting points (uncorrected) were obtained on Shanghai Inesa WRS-3 melting point apparatus. The starting materials were purchased from Innochem or Energy Chemicals and used without further purification. Solvents were dried and purified according to the procedure from “Purification of Laboratory Chemicals book”. The crude products were purified by flash column chromatography on silica gel and the reported yields are the actual isolated yields of pure products. Thin-layer chromatography (TLC) was performed using 60 mesh silica gel plates visualized with short-wavelength UV light (254 nm).

2. General Procedures

2.1 Synthesis of substrates 1

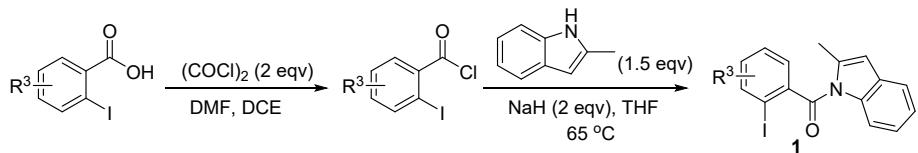

Synthesis of substrates 1a-1i, 1o: To a solution of indole derivative (1.0 equiv, 0.5 M) in THF was added 60% dispersion of NaH (1.2 equiv) in portions at 0 °C. After stirring at 0 °C for 30 min, a solution of acid chloride in THF was added dropwise to the reaction system. The mixture was then allowed to stir at room temperature. When the reaction was completed, the reaction mixture was quenched by aqueous NH_4Cl and extracted with EtOAc. The combined organic phase was dried over Na_2SO_4 and concentrated under reduced pressure. The residue was purified by column chromatography using the indicated fluent to give the substrates.

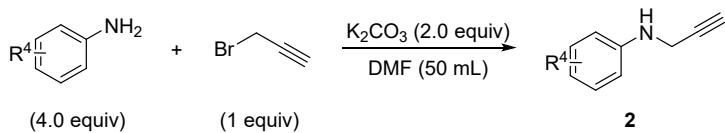

Synthesis of substrates 1j-1n: The appropriate substituted phenylhydrazine (1.0 mmol) and substituted acetophenone (1.0 mmol) were mixed in ethanol (20 mL) and a few drops of glacial AcOH were added. The solution was heated under reflux at 80 °C for 1-2 h. The solvents were evaporated in vacuo to give a solid that was added to polyphosphoric acid (PPA) (30 mL), and the mixture slowly heated to 120 °C and kept at this temperature for a few hours until the reaction was complete (TLC monitoring). The mixture was allowed to cool and then poured into cold water (50 mL). The acidic solution was neutralized by the slow addition of 1 M NaOH (aq) and the solid precipitate of crude

product was collected. Purification by column chromatography (hexane/ethyl acetate) gave the required indole products.

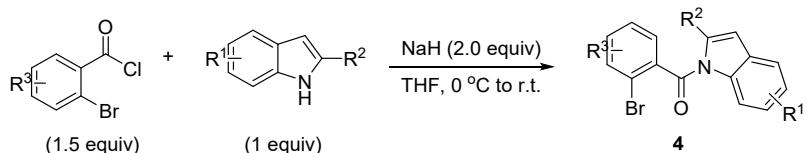

Synthesis of substrates 1p, 1q, 1r: In a flame dried flask under argon, oxalyl chloride (2.0 equiv) was added slowly to a solution of 2-iodo benzoic acid in DCM (0.5 M) with a few drops of DMF at 0 °C. The suspension was allowed to warm to room temperature and was stirred for 3 hours. The solvent was removed in-Vacuo, and the resulting yellow solid was put under argon. In a separate flame dried flask, to a solution of 2-methyl indole in THF (0.5 M) was added NaH (2.0 equiv) at 0 °C. The reaction was let stir until the gas evolution ceased. The yellow acyl chloride was suspended in THF and added *via* 3 aliquots dropwise at 0 °C. The reaction was allowed to warm to room temperature and was then heated to 65 °C overnight. Upon completion the reaction was quenched with H₂O and extracted 3 x EtOAc. The product was purified *via* silica gel chromatography with a solvent gradient of 100:1 pentane: triethylamine to 50:1:1 pentane: triethylamine: EtOAc.

2.2 Synthesis of substrates 2

To a mixture of K₂CO₃ (2.0 equiv) and *p*-toluidine (4.0 equiv) in DMF solvent was added 3-bromopropyne (1.0 equiv) dropwise at rt and stirred overnight. The reaction mixture was quenched with ice cold water and extracted with EtOAc (3x). The combined extracts were dried over anhydrous Na₂SO₄. The dried extracts were concentrated, and the crude product was purified by flash column chromatography on silica gel using 5% ethyl acetate in petroleum ether as eluent to afford the pure products.

2.3 Synthesis of substrates 4

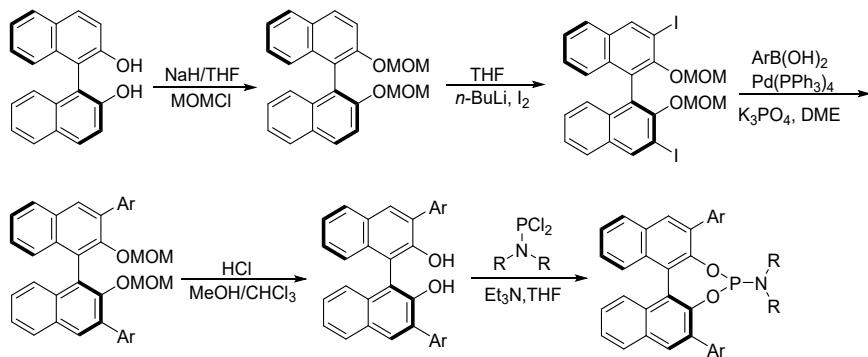

A 60% dispersion of NaH in mineral oil (2.0 equiv) was added to a stirred solution of the appropriate indole derivative (1 equiv, ~0.5 M) in THF at 0 °C and the corresponding solution was stirred for 5 minutes before warming to room temperature where it was stirred for 30 minutes. The solution of the sodium indolate was re-cooled to 0 °C at which time a solution of appropriate 2-bromobenzoyl chloride derivative (1.5 equiv, ~1 M) in THF was added dropwise. Once the addition was complete, the reaction was allowed to warm to room temperature and then was stirred at 65 °C for 30 minutes. At this time the extent of completion of the reaction was determined by conversion of the

indole derivate by TLC analysis. The reaction was cooled to room temperature and quenched with a saturated solution of NH₄Cl. The reaction mixture was then diluted with water and EtOAc, and after separating the layers, the aqueous layer was extracted with EtOAc (3x). The combined organic layers were washed sequentially with water and brine, dried over sodium sulfate, filtered and concentrated under reduced pressure. The crude *N*-(2-bromobenzoyl) indole derivative was purified by flash column gel chromatography using the indicated solvent system.

2.4 Synthesis of chiral phosphoramidite ligands L₁-L₆

The preparation of chiral phosphoramidite ligands L₁-L₆ were prepared according to the known method. [1, 2]

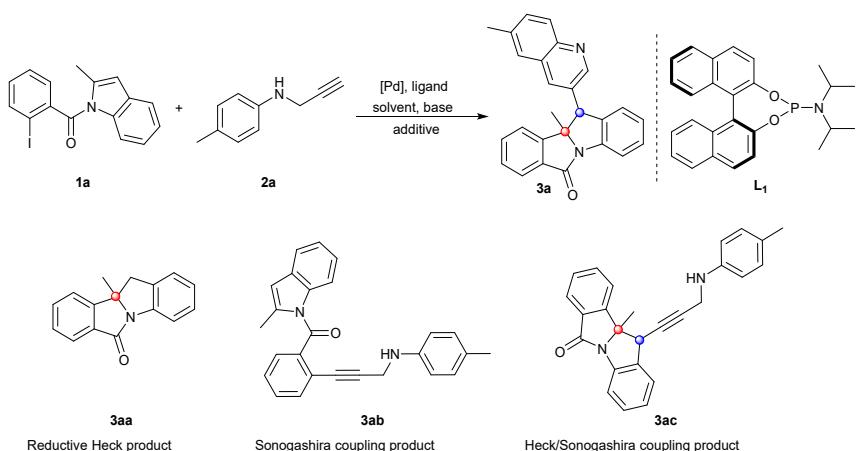

General Procedure a: To a solution of *N,N*-diisopropylamine (20.0 mmol) in dry THF (15 mL) at 0 °C was added *n*-BuLi (2.5 M in hexanes, 20 mmol) dropwise over 3 min under argon atmosphere. After stirring at 0 °C for 30 min, PCl₃ (60.0 mmol) was added to the reaction mixture in one portion. The resulting mixture was warmed to room temperature, stirred for 1 h, and then concentrated at room temperature. The remaining PCl₃ was removed under vacuum. dry THF (30 mL) was then added to the resulting residue. After stirring for 10 min, the mixture was cooled to 0 °C, followed by addition of a solution of 3,3'-disubstituted binaphthyl compound (10.0 mmol) and Et₃N (33.0 mmol) in dry THF (15 mL) over 2 min. The mixture was warmed to room temperature and stirred overnight. Then it was filtered and the solid was washed with THF. The residue was purified by chromatography on silica gel, eluting with PE:DCM = 10:1 (v/v) to afford the ligand L₁-L₆.

^aUnless otherwise noted, all reactions were performed with **1a** (0.1 mmol), **2a** (2.0 equiv), [Pd] (10 mol %), Cu₂O (20 mol %), ligand (12 mol %), and base (2.0 equiv) in solvent (1.0 mL) at 100 °C for 19 h.

^bYields are given for isolated products, diastereoselectivity of the product is > 20:1. ^cThe reaction was conducted at 80 °C. ^dThe reaction was conducted at 90 °C. ^eThe reaction was conducted at 110 °C. ^fThe reaction was conducted in the absence of Cu₂O.

The initial investigation began by employing aryl iodide **1a** as the starting point and 4-methyl-*N*-(prop-2-yn-1-yl)aniline **2a** as the coupling reagent. It has turned out that dearomatic Heck annulation/phenyl electrophilic addition product **3a** was challenging to be obtained due to the reason that a series of by-products including reductive Heck by-product **3aa**, Sonogashira coupling by-product **3ab**, and Heck/Sonogashira coupling by-product **3ac** were observed in this transformation. To our gratification, the reaction worked well in the presence of Pd₂(dba)₃ (10 mol %), Cu₂O (20 mol %), PPh₃ (12 mol %), and Cs₂CO₃ (2.0 equiv) in tetrahydrofuran at 100 °C for 19 h and led to the desired product **3a**, Sonogashira coupling by-product **3ab**, and Heck/Sonogashira coupling by-product **3ac** in 24%, 11%, 23% yields, respectively. And 39% of the raw material **1a** was recycled (Table 1, entry 1). A subsequent exploration on the effect of solvent was investigated, the reactions in 1,2-dichloroethane, 1,4-dioxane, and toluene furnished the corresponding product **3a** in 50%, 36%, and 46% yields, respectively, while no product was observed in acetonitrile. Nevertheless, the reductive Heck by-product **3aa** was obtained in 65% yield in acetonitrile, which suggested that strong polar solvent was beneficial to the assembly of reductive Heck by-product (entries 2-5). Some representative inorganic bases were then examined, which revealed that K₂CO₃ was found to be superior to Cs₂CO₃, while tBuOLi, KHCO₃, NaHCO₃, and Na₂CO₃ were inefficient in promoting the efficiency of the transformation. Of note, the effect of base had a weak influence on the yield of this transformation(entries 6-10). Upon further screening of various palladium catalysts such as Pd(PPh₃)₂Cl₂, Pd(PPh₂Me)₂Cl₂, Pd(OAc)₂, and Pd(PPh₃)₄ indicated that Pd(PPh₃)₄ was optimal for the catalytic system, which afforded **3a** in 59% yield. And Pd(PPh₃)₂Cl₂, Pd(PPh₂Me)₂Cl₂, and Pd(OAc)₂ catalysts were favorable to form Heck/Sonogashira coupling by-product **3ac**, reductive Heck by-product **3aa**, and Heck/Sonogashira coupling by-product **3ac**, respectively (entries 11-14). Next, various monodentate and bis-monodentate phosphorus ligands were surveyed, regrettably, no better result was obtained. Among which, bis-monodentate phosphorus ligand DPPF could not furnish the desired product (entries 15-18). Gratifyingly, simply by switching from PPh₃ to phosphoramidite ligand **L₁** under otherwise identical conditions did enhance remarkably the efficiency of the reaction, and the yield of **3a** was obviously increased to 78% (entry 19). Distinctly lower yields were observed by decreasing the temperature to 80 °C and 90 °C, leading to the desired product in 41% and 63% yields, respectively, accompanying the recovery of 42% and 20% raw material (entries 20-21). In sharp contrast, the result was sharply enhanced to 89% yield when carrying out the reaction at 110 °C (entry 22). Of note, a lower yield of 55% was obtained in the absence of Cu₂O with the recovery of 33% raw material, suggesting that Cu₂O may act as a critical additive in this transformation (entry 23). The molecular configuration of **3a** was definitely established by X-ray crystallographic analysis. Of note, the desired product was afforded with excellent diastereoselectivity (> 20:1), which was determined by ¹H NMR analysis. Ultimately, the optimized conditions were identified to be; aryl iodide **1a** (0.1 mmol) and 4-methyl-*N*-(prop-2-yn-1-yl)aniline **2a** (2.0 equiv) in the presence of Pd(PPh₃)₄ (10 mol %), Cu₂O (20 mol %), phosphoramidite ligand **L₁** (12 mol %), and K₂CO₃ (2.0 equiv) in 1,2-dichloroethane at 110 °C for 19 h under an argon atmosphere.

8. Computational details

Quantum chemistry calculations were conducted with the Gaussian 09 software package^[3]. The structures were optimized by the density functional theory (DFT)^[4] with B3LYP-D3 functional^[5,6] on basis of def2-SVP^[7] using SMD^[8] continuum solvent model (solvent = dichloroethane). Frequency analyses were performed at the same level of theory to verify the stationary points to be real minima or saddle points and to obtain the thermodynamic energy corrections at 383.15K. All transition states were confirmed by intrinsic reaction coordinate (IRC), and calculations were performed to confirm the connection between two correctminima for a transition state. In order to get more accurate electronic energies, the single point energy were calculated at the M06^[9-10]-D3/def2-TZVP level of theory using SMD continuum solvent model (solvent = dichloroethane).
