## **Experimental Section**

**General Information.** The spectral data of known products were comprised with literature. Reagents and solvents were purchased from chemical companies. Melting points were determined in capillary tubes. The progress of the reaction and the purity of compounds were monitored by thin layer chromatography (TLC) analytical silica gel plates (Merck 60 F250). The <sup>1</sup>H-NMR (250 and 400 MHz) and <sup>13</sup>C-NMR (100 MHz) were run on 250 and 400 NMR spectrometers. The elemental analysis was performed on a microanalyzer.

### **General procedure for the synthesis of benzimidazoles**

In a 25 mL round-bottom flask contained a suspension of Fe(III)-porphyrin complex (0.1 mol %) in ethanol (5.0 mL), benzo-1,2-quinone (1.0 mmol), NH<sub>4</sub>OAc (2.2 mmol), and aromatic aldehyde (1.0 mmol) were added and the resulting mixture was stirred at room temperature under the air atmosphere. The progress of the reaction was monitored by thin-layer chromatography (TLC). After completion of the reaction, water was added to the solution and products was extracted with EtOAc dried over anhydrous Na<sub>2</sub>SO<sub>4</sub> and concentrated under reduced pressure. The crude products were purified by column chromatography on silica gel to give the pure products.
