Materials and methods

Materials

All chemical reagents, biological samples and materials were obtained from commercial suppliers, and all chemical reagents were used as purchased without purification. The silica gels (100–200 mesh, AR) were used for the purification of synthesized compounds. Spectrally pure dimethyl sulfoxide (DMSO) and 9,10-anthracenediylbis(methylene)dimalonic acid (ABDA, 90%) were purchased from J&K. Fetal bovine serum (FBS), penicillin and streptomycin were obtained from Gibco. Roswell Park Memorial Institute 1640 (RPMI 1640), Dulbecco's Modified Eagle Medium (DMEM) and phosphate buffered saline (PBS, 10 mM, pH = 7.4) were purchased from Gibco or Bioagrio. Cell Counting Kit-8 (CCK-8) were obtained from Solarbio. MitoTracker® Deep Red FM were purchased from BioDee. Singlet-oxygen sensor green (SOSG) were obtained from Sigma-Aldrich (MO, USA).

General instruments

¹H NMR spectra were recorded on a Brüker AV-400 spectrometer, using deuterated reagents (CDCl₃ or DMSO-*d*₆) as the solvents, and tetramethylsilane (TMS) as the internal standard. The high-resolution mass spectra (HRMS) were obtained on an HP 5958 mass spectrometer with the electronic spray ionization mode. Absorption and fluorescence spectra were obtained on a Varian Cary 500 UV-Vis spectrophotometer and Edinburgh FLS1000 photoluminescence spectrometer, respectively. Transmission electron microscopy (JEM-1400) studies were performed at the Instrumental Analysis Center of East China University of Science and Technology to investigate the morphology and size of nanoaggregates. Dynamic light scattering (DLS) and zeta potential measurement were conducted using Zetasizer Nano particle analyser series (Malvern Nano ZSE, UK) at room temperature. White light source for ROS generation experiment came from commercial LED lamps (SF-582, SF-T100). The cell imaging was implemented with a confocal laser scanning microscope (CLSM, Nikon) at the Instrumental Analysis Center of East China University of Science and Technology. The live mice were imaged with a Living Image system and the relative fluorescence intensity was analyzed by Living Image 4.3.1 software (Caliper).

Theoretical calculations

Theoretical calculation was carried out using the Gaussian 09 software. Optimization for the geometries of TPEPF₆, TPAPF₆ and DEAPF₆ at the ground state were operated at B3LYP/6-31G* level. Then calculation for HOMOs and LUMOs were performed at the same level. Excited triplet state was calculated at PBE0/6-31G* level by time-dependent density functional theory (TD-DFT). The electron-hole distribution analysis was based on TD-DFT unrelaxed excited-state densities as provided by the Multiwfn software.^{S1}

The results suggested that the HOMO of TPEPF₆ is mainly distributed on the TPE unit and the adjacent cyano group, while its LUMO is basically dominated by the orbitals from the (*Z*)-4-(2-cyano-2-phenylvinyl)pyridin-1-ium moiety. It suggests the significant ICT from the acrylonitrile-substituted TPE moiety to the (*Z*)-4-(2-cyano-2-phenylvinyl)-pyridin-1-ium part. Likewise, marked ICT from the acrylonitrile-decorated TPA unit to the (*Z*)-4-(2-cyano-2-phenylvinyl)-pyridin-1-ium moiety is clearly revealed by the HOMO and LUMO of TPAPF₆. The case is similar but different in DEAPF₆. The electron clouds of HOMO are mainly situated on the DEA and the neighbouring 2-phenylacrylonitrile groups, while the LUMO is primarily occupied by the orbits from the (*Z*)-4-(2-cyano-2-phenylvinyl)pyridin-1-ium unit, implying the ICT from the 2-phenylacrylonitrile-furnished DEA to the (*Z*)-4-(2-cyanovinyl)pyridin-1-ium.

Spectral measurements

The stock solution of TPEPF₆, TPAPF₆ and DEAPF₆ were prepared in DMSO (10⁻³ M) and used for specific

experiments after appropriate preparation. All spectra of the solutions were obtained in 1 cm quartz cuvettes.

Investigation of size, zeta potential and morphology

Transmission electron microscopy (TEM) observation and dynamic light scattering (DLS) analysis were carried out to study the morphology of the aggregates of these three compounds formed in the DMSO/toluene mixtures with different toluene fractions ($f_T = 50, 80,$ and 90 vol% for DLS measurement, and $f_T = 80$ and 90 vol% for TEM test). DLS measurement of AIE-PSs in DMSO/toluene mixtures with different toluene fractions was carried out using a Zetasizer Nano particle analyser series (Malvern Nano ZSE, UK) at 25 °C. Zeta-potentials of AIE-PSs in DMSO/H₂O ($v/v = 1/99$) were measured using the same instrument. Zetasizer software was used to process and analyze the data. TEM images were recorded by a JEM-1400 transmission electron microscope. Measurements were performed by dropping 10 μ L samples onto carbon-coated copper grids. After removing the excess solution by blotting paper, the samples were dried under ambient conditions.

Crystallography analysis of TPAPF₆

Perfect single crystals of TPAPF₆ were successfully obtained by slowly evaporating the mixture of THF/hexane. The X-ray crystallography analysis helps to elucidate the molecular conformation and molecular arrangement of these analogue AIEgens. The crystal was resolved on Bruker APEX-II CCD with a radiation of CuK α at a wavelength of 1.54178 (Å). The data was further analyzed with SHELXL-2018/3.

Detection of ¹O₂ in solution

The ¹O₂ production was determined by using 9,10-anthracenediylbis(methylene)dimalonic acid (ABDA) as an indicator. The stock solutions of ABDA and photosensitizers in DMSO were added into ultrapure water to afford the DMSO/water solutions ($v/v, 1/100$). Then the mixed solutions were exposed to white light (400 – 800 nm, 25 mW/cm²) irradiation from 0 to 120 s. The absorbances of ABDA at 378 nm were recorded at different irradiation time to obtain the decay rates of the photosensitizing processes. The effectiveness of photosensitizer-generated ¹O₂ was evaluated by A/A_0 , where A_0 is the initial absorbance at 378 nm, while A represents the final absorbance at 378 after white-light irradiation.

Singlet-oxygen quantum yield calculation

The singlet-oxygen quantum yields of TPEPF₆, TPAPF₆ and DEAPF₆ (Φ_{PS}) were determined using Rose Bengal (RB) as the standard reference. To conduct the experiments, ABDA was added into AIE-PSs or RB solution to give a working concentration of 50 μ M (DMSO/H₂O = $1/100, v/v$). To eliminate the inner-filter effect, the absorption maxima were controlled at *ca.* 0.2 . The singlet-oxygen quantum yields are calculated using the following equation:

$$\Phi_{PS} = \Phi_{RB} \frac{\kappa_{PS} \times A_{RB}}{\kappa_{RB} \times A_{PS}}$$

where κ_{PS} and κ_{RB} represent the decomposition rate constants of the photosensitizing process determined by the plot of $\ln(A_0/A)$ versus light irradiation time, A_0 is the initial absorbance of ABDA while A is the ABDA absorbance after irradiation for different time; A_{RB} and A_{PS} refer to the light absorbed by RB and AIE-PSs, respectively, calculated by the integration of their absorption spectra from 400 to 800 nm; Φ_{RB} is the singlet-oxygen quantum yield of RB, which is 0.75 in water.^{S2}

Cell culture and cell imaging

Five cancer cell lines, namely mouse breast cancer cells (4T1), human embryonic kidney 293T cells (293T), human lung adenocarcinoma cells (A549), and ovarian cancer cells (SK-OV-3) were obtained commercially. 4T1, SK-OV-3, and A549 cells were cultured in modified 1640 medium containing 10% fetal bovine serum (FBS) and 1% penicillin-streptomycin (complete 1640). 293T cells were cultured in DMEM medium containing 10% FBS and 1%

penicillin-streptomycin (complete DMEM). All cells were incubated at 37 °C in a humidified atmosphere of 5% CO₂. Cells were seeded in cell culture dishes for 2 days and passed at 95% cell confluency. Before the experiment, the medium was removed and the attached cells were washed 3 times with PBS buffer to remove the remaining growth medium.

4T1 and SK-OV-3 cells in exponential phase were cultured individually on 35 mm-glass-bottom dishes for 24 hours before confocal microscopic imaging of the cells with the AIE-PSs, reaching approximately 80% confluency. On the day of treatment, the cell staining was conducted by replacing the cell culture medium with AIE-PS-containing culture medium. Then the cells were washed with 1 mL of PBS for three times at room temperature and 1 mL of complete medium was added and observed via confocal laser scanning microscope (CLSM).

Detection of singlet-oxygen in living cells

The intracellular ROS generation under white-light irradiation was detected by using SOSG as an indicator and studied by CLSM. 4T1 cells and SK-OV-3 cells were seeded and cultured in confocal plates (35 mm-glass-bottom culture dishes) for 12 h. Then the culture media were replaced with 1 mL of fresh medium containing AIE-PSs (10 μM) and the cells were incubated for another 1 h at 37 °C, the cells were irradiated by white light (100 mW/cm²) for different periods of time. Afterwards, the cells were incubated with 1 mL of fresh medium containing 5 mM SOSG (10 μL) for 30 min at 37 °C. Finally, the cells were rinsed with PBS for three times and the fluorescence signals of the cells were captured by CLSM imaging. For the collection of fluorescence signal given by TPEPF₆, the excitation was 405 nm and the emission was collected at 570–620 nm. For the collection of fluorescence signal given by TPAPF₆ or DEAPF₆, the excitation was 488 nm and the emission was collected at 660–730 nm. For the collection of fluorescence signal given by SOSG, the excitation was 488 nm and the emission was collected at 500–530 nm. No background fluorescence of cells was detected under the set conditions.

Co-staining assay by CLSM

The SK-OV-3 and 4T1 cells were selected for the co-staining assay experiments. When the cells achieved around a confluence of 80%, the cells in 35 mm-glass-bottom dishes were cultured with AIE-PSs for 1 h and washed for three times with PBS solution (1 mL). Then, the cells were incubated with MitoTracker® Deep Red FM (commercially purchased fluorescent dye for the mitochondria-specific staining) for 1 h under standard operation conditions. Afterwards, the cells were washed three times with PBS solution (1 mL), and fluorescence images were taken by a CLSM (Laser wavelength: 647 nm for MitoTracker® Deep Red FM; 405 nm for TPEPF₆; 488 nm for TPAPF₆ and DEAPF₆; the emission filter: MitoTracker® Deep Red FM: 650–670 nm; TPEPF₆: 570–620 nm; TPAPF₆ and DEAPF₆: 660–730 nm). The false color of MitoTracker® Deep Red FM was given as green and the false color of AIE-PSs was given as red.

Cell viability test

The cell viability of 293T, A549, SK-OV-3, and 4T1 cells was determined after incubation with AIE-PSs under white-light irradiation (100 mW/cm², 30 min) using a Cell-Counting-Kit-8 (CCK-8). Briefly, on a 96-well plate, the cells were inoculated at a density of 1×10⁴ cells/well in 100 μL of complete medium and cultured at 37 °C with 5% CO₂. After the cells being incubated for 12 h, the old medium was replaced with 200 μL fresh medium containing different concentrations of AIE-PSs (0, 1, 2, 5, 10, 20, 50 and 100 μM) and the cells were further incubated at 37 °C. After 1 h, the plates were irradiated with white light (400–800 nm, 100 mW/cm²) for 30 min. All cells with or without light irradiation were cultivated for another 4, 12 or 24 h to support the cell proliferation. After culturing for different time, 100 μL of serum-free medium containing 10% CCK-8 was added to each well, and the 96-well plate was subsequently incubated at 37 °C for 2 h. Finally, their optical density (OD) values were read at 450 nm, the cell viability rates were calculated by $(OD_{\text{sample}} - OD_{\text{blank}}) / (OD_{\text{control}} - OD_{\text{blank}}) \times 100\%$. The results were presented as a mean ± standard

deviation obtained from six samples.

Animals and tumor model

The female BALB/*c* mice were obtained from Vital River and fed under standard housing conditions. 4T1 cells (5×10^5) in 50 μ L PBS were subcutaneously inoculated into the hip of each mouse. The tumor growth was monitored every day, and the volume of tumor was measured with a vernier caliper and quantified using $(\text{tumor length}) \times (\text{tumor width})^2 / 2$. When the tumors grew to a certain size, the 4T1 tumor-bearing mice were used for fluorescence imaging and further therapy studies. All the mice used were handled strictly in accordance with governmental and international guidelines on animal experimentation. Mice were free to obtain sterile food and water. The animal experiments have been approved by the Laboratory Animal Ethics Committee of East China University of Science and Technology (No. ECUST-2021-03001).

***In vivo* study on tumor visualization**

The Living Image 4.3.1 software (Caliper) was utilized to image the mice. Mice bearing 4T1 tumors were randomly divided into three groups (PBS, TPAPF₆ and TPAPF₆+light) and intratumorally injected with 50 μ L of TPAPF₆ (4 mg/kg, $w_{\text{probe}}/w_{\text{mouse}}$) or PBS ($n = 3$ per group); For the TPAPF₆+light group, mice were treated by light illumination for 10 min. *In vivo* fluorescence imaging of 4T1 tumor in mice at different time points after intratumor injection of PBS or TPAPF₆ was conducted afterwards. The excitation wavelength applied was 465 nm, and the fluorescence signals were collected at 700 nm and 760 nm, respectively. At 24 h post injection, the mice were sacrificed while the tumor and major organs were isolated and imaged, then the fluorescence images were taken by the same equipment using the same conditions as those for the mice bodies.

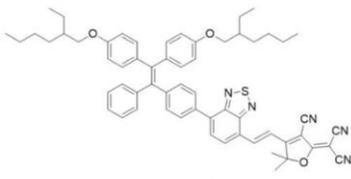

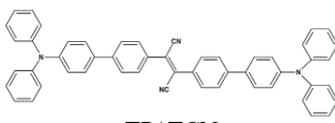

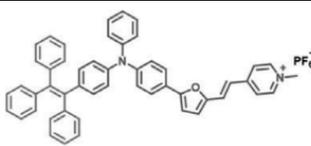

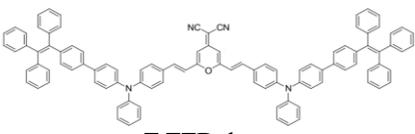

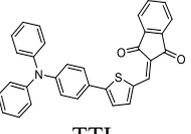

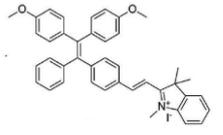

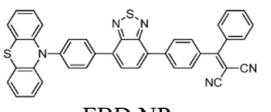

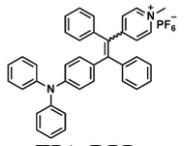

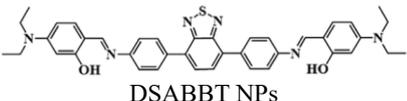

***In vivo* therapy study**

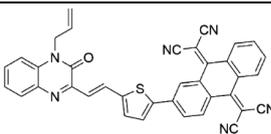

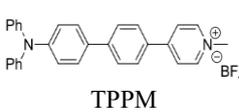

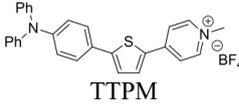

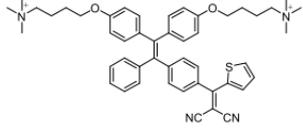

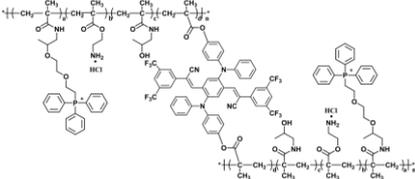

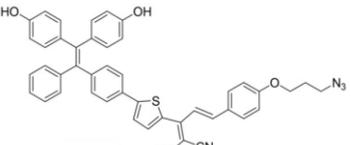

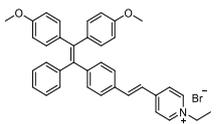

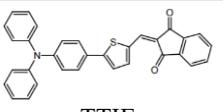

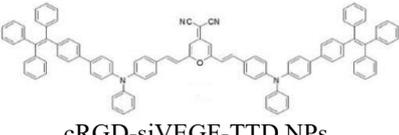

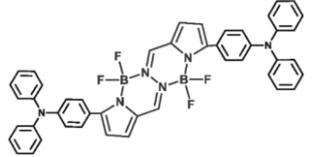

In this experiment, BALB/*c* mice bearing 4T1 subcutaneous tumors were divided into four groups ($n = 5$ per group) in random. Thereafter, the mice were treated by intratumor injection of (1) PBS (100 μ L) without white-light irradiation, or (2) PBS (100 μ L) and subjected to white-light irradiation, or (3) TPAPF₆ (100 μ L of probe solution, $w_{\text{probe}}/w_{\text{mouse}} = 8$ mg/kg) without white-light irradiation, or (4) TPAPF₆ (100 μ L of probe solution, $w_{\text{probe}}/w_{\text{mouse}} = 8$ mg/kg) and then irradiated with white light. Four hours later, mice of groups (2) and (4) were irradiated with white light (200 mW/cm²) for 20 min. The treatments were conducted every two days and spanned a therapy duration of 12 days for all groups. The tumoricidal capacity was also continually estimated by tumor volume and mice body weight after various treatment every day. The volume of tumor was measured with a vernier caliper and quantified using $(\text{tumor length}) \times (\text{tumor width})^2 / 2$. On day 11 after treatment, blood was taken from the eye socket of each mouse for serum biochemical analysis. Furthermore, the mice in all these four groups were sacrificed and their tumor tissues were then excised to measure the tumor volume after treatment for 12 days. The main organs including heart, liver, spleen, lung, and kidney were resect for H&E staining.

Statistical analysis

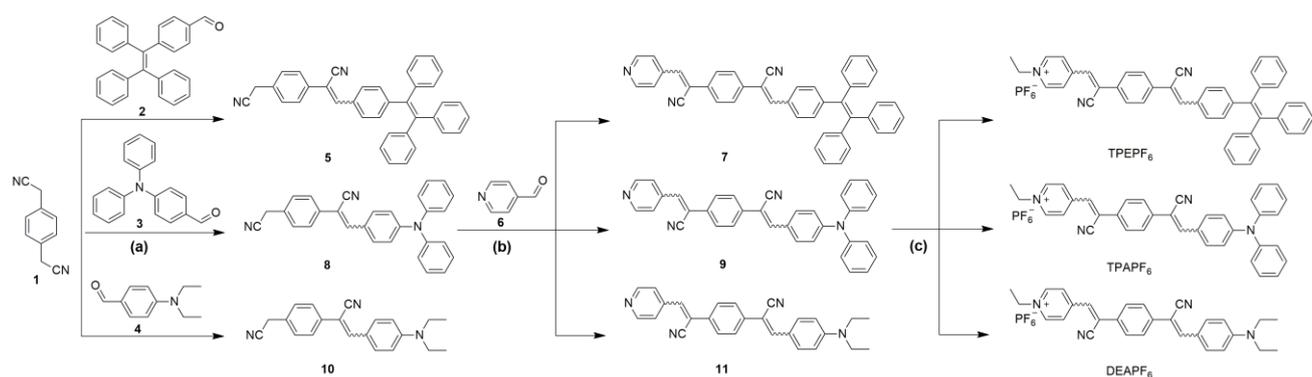

Statistical analyses were carried out by Stata software and the differences between various groups were performed by Student's *t*-test. All the data were expressed as mean \pm standard deviation (SD). A value of $P < 0.05$ was considered significant and was indicated with asterisks, such as $*P < 0.05$, $**P < 0.01$, and $***P < 0.001$. Statistical analysis was performed by Graph pad Prism 8.0. Each experiment included at least three replicates.

Synthesis of TPEPF₆, TPAPF₆ and DEAPF₆

Scheme S1. The synthetic routes to TPEPF₆, TPAPF₆ and DEAPF₆. Conditions: (a) NaOH, EtOH/THF, R.T.; (b) Piperidine, EtOH, 90 °C; and (c) i) CH₃CH₂I, acetonitrile, 95 °C; ii) KPF₆, acetone, 65 °C.

4-(1,2,2-Triphenylvinyl)benzaldehyde (2): Compound **2** was prepared according to the methods reported in the literature.^{S3} ¹H NMR (400 MHz, CDCl₃) δ 9.90 (s, 1H), 7.61 (d, J = 8.2 Hz, 2H), 7.19 (d, J = 8.2 Hz, 2H), 7.12 (dd, J = 6.2, 3.8 Hz, 9H), 7.02 (dt, J = 9.5, 5.0 Hz, 6H).

(Z)-2-(4-(Cyanomethyl)phenyl)-3-(4-(1,2,2-triphenylvinyl)phenyl)acrylonitrile (5): 2,2'-(1,4-Phenylene)diacetonitrile (**1**, 468.2 mg, 3.0 mmol) was added to a three-necked round-bottom flask, and 7.5 mL of THF and 2.5 mL of EtOH were added. 4-(1,2,2-Triphenylvinyl)benzaldehyde (**2**, 360.2 mg, 1.0 mmol) and sodium hydroxide (20.0 mg, 0.5 mmol) was dissolved in the mixture of THF (15 mL) and EtOH (5 mL), respectively, then added into the constant pressure dropping funnel. The flask was evacuated under vacuum and flushed with dry N₂ for three times. The reaction was started by slowly opening the constant pressure dropping funnel. The mixture was stirred for 6 h at R.T. and then was poured into water and extracted with dichloromethane for three times. The collected organic layers were concentrated by rotatory evaporation, and the residue was purified by the silica gel column chromatography with petroleum ether/ethyl acetate (20/1, v/v) as an eluent, and the pure product of compound **5** was obtained as a yellow-green solid (255.2 mg, 51.2%). ¹H NMR (400 MHz, CDCl₃) δ (TMS, ppm): 7.66 (dd, J = 8.3, 5.2 Hz, 4H), 7.44–7.36 (m, 3H), 7.20–7.09 (m, 11H), 7.08–6.99 (m, 6H), 3.79 (s, 2H). ¹³C NMR (100 MHz, CDCl₃) δ (TMS, ppm): 146.85, 143.27, 143.14, 142.49, 139.95, 134.71, 131.99, 131.36, 131.29, 130.73, 128.87, 128.65, 127.89, 127.71, 126.94, 126.76, 126.62, 117.92, 117.37, 109.62, 23.37. HRMS for C₃₇H₂₆N₂ [M]⁻, calculated: 497.2018; found: 497.2023.

(Z)-2-(4-((Z)-1-Cyano-2-(4-(1,2,2-triphenylvinyl)phenyl)vinyl)phenyl)-3-(pyridin-4-yl)acrylonitrile (7): Compound **5** (498.2 mg, 1.0 mmol) and compound **6** (114.6 μ L, 1.2 mmol) were dissolved in 20 mL of EtOH, and piperidine (8.5 μ L, 0.1 mmol) was then added dropwise into the reaction system. The mixture was heated to 90 °C and stirred for 12 h, after cooling to room temperature, the solvent was removed by rotatory evaporation. Dichloromethane (30 mL) was added and the organic phase was washed with water (50 mL \times 3). Then the organic phase was collected and dried by Na₂SO₄, and the solvent was removed under reduced pressure. The obtained residue was separated by silica-gel column chromatography (petroleum ether/ethyl acetate = 1/1) to obtain the desired product as orange-yellow solid (480.3 mg, 81.8%). ¹H NMR (400 MHz, CDCl₃) δ (TMS, ppm): 8.78 (d, J = 5.0 Hz, 2H), 7.81–7.72 (m, 6H), 7.70 (d, J = 8.4 Hz, 2H), 7.52 (d, J = 12.0 Hz, 2H), 7.19–7.09 (m, 11H), 7.09–7.00 (m, 6H). ¹³C NMR (100 MHz, CDCl₃) δ (TMS, ppm): 150.51, 146.37, 142.79, 140.79, 138.70, 137.00, 133.76, 133.12, 131.09, 129.88, 129.70, 129.67, 129.60, 126.98, 126.87, 126.31, 125.87, 120.53, 118.44, 115.81, 108.85, 105.89. HRMS for C₄₃H₂₉N₃ [M]⁺, calculated: 588.2440; found: 588.2414.

4-((Z)-2-Cyano-2-(4-((Z)-1-cyano-2-(4-(1,2,2 triphenylvinyl)phenyl)vinyl)phenyl)vinyl)-1-ethylpyridin-1-

ium (TPEPF₆): A mixture of compound **7** (588.2 mg, 1.0 mmol) and iodoethane (115.2 μ L, 1.2 mol) was dissolved in 15 mL of acetonitrile under an atmosphere of nitrogen. The mixture was heated to 95 °C and then refluxed for 6 h. After cooling to room temperature, the solvent was removed by rotatory evaporation. Then mixed residue was dissolved in 15 mL of acetone and added 3 mL of saturated aqueous solution of KPF₆. After being fully dissolved, the mixture was heated to 65 °C and then refluxed for 3 h. After being cooled to room temperature, the solvent was removed under reduced pressure. The raw product was extracted three times using dichloromethane and water. The organic layers were combined and dried by anhydrous MgSO₄. After filtration, the solvent was removed under reduced pressure, and the resultant product was washed with ethyl acetate to give TPEPF₆ as a red solid (631.8 mg, 83.0% yield). ¹H NMR (400 MHz, DMSO-*d*₆) δ (TMS, ppm): 9.22 (d, *J* = 6.8 Hz, 2H), 8.48 (d, *J* = 6.7 Hz, 2H), 8.44 (s, 1H), 8.12 (s, 1H), 7.99 (q, *J* = 8.7 Hz, 4H), 7.78 (d, *J* = 8.4 Hz, 2H), 7.17 (dt, *J*₁ = 8.8 Hz, *J*₂ = 4.2 Hz, 11H), 7.07–6.95 (m, 6H), 4.66 (q, *J* = 7.3 Hz, 2H), 1.59 (t, *J* = 7.3 Hz, 3H). ¹³C NMR (150 MHz, DMSO-*d*₆) δ (TMS, ppm): 193.41, 151.09, 150.47, 149.58, 141.29, 140.76, 136.61, 131.92, 126.77, 125.44, 122.72, 122.67, 122.64, 122.13, 119.19, 114.02, 100.15, 43.83, 12.41. HRMS for C₄₅H₃₄N₃⁺ [M-PF₆], calculated: 616.2753; found: 616.2757.

(Z)-2-(4-(Cyanomethyl)phenyl)-3-(4-(diphenylamino)phenyl)acrylonitrile (8): Similar to the synthesis of compound **5**, except that the starting materials were compound **1** (468.2 mg, 3.0 mmol) and compound **3** (273.1 mg, 1.0 mmol). The crude product was purified by silica-gel column chromatography using petroleum ether/ethyl acetate (v/v, 15/1) as eluent to obtain the desired product as yellow solid (246.7 mg, 60.0%). ¹H NMR (400 MHz, DMSO-*d*₆) δ (TMS, ppm): 7.93 (s, 1H), 7.86 (d, *J* = 8.9 Hz, 1H), 7.75 (d, *J* = 8.4 Hz, 1H), 7.58–7.23 (m, 8H), 7.16 (p, *J* = 7.3 Hz, 4H), 7.06 (dd, *J* = 8.2, 4.1 Hz, 2H), 6.96 (d, *J* = 8.8 Hz, 1H), 6.67 (d, *J* = 8.8 Hz, 1H), 4.09 (t, *J* = 8.4 Hz, 2H). ¹³C NMR (100 MHz, CDCl₃) δ (TMS, ppm): 150.22, 146.51, 142.28, 135.06, 130.84, 130.14, 129.60, 128.48, 126.37, 126.04, 125.89, 125.75, 124.46, 120.62, 118.60, 117.51, 106.52, 23.37. HRMS for C₂₉H₂₁N₃ [M]⁺, calculated: 412.1814; found: 412.1805.

(Z)-2-(4-((Z)-1-Cyano-2-(4-(diphenylamino)phenyl)vinyl)phenyl)-3-(pyridin-4-yl)acrylonitrile (9): Similar to the synthesis of compound **7**, except that the starting materials were compound **8** (411.2 mg, 1.0 mmol) and compound **6** (114.6 μ L, 1.2 mmol). The crude product was purified by silica-gel column chromatography using petroleum ether/ethyl acetate (v/v, 2/1) as eluent to obtain compound **9** as orange-red solid. Yield: 426.2 mg, 85.2%. ¹H NMR (400 MHz, DMSO-*d*₆) δ (TMS, ppm): 8.78 (dd, *J* = 4.5, 1.6 Hz, 2H), 8.20 (s, 1H), 8.06 (s, 1H), 7.97–7.87 (m, 6H), 7.83 (dd, *J* = 4.8, 1.4 Hz, 2H), 7.46–7.36 (m, 4H), 7.25–7.13 (m, 6H), 6.97 (d, *J* = 8.9 Hz, 2H). ¹³C NMR (100 MHz, CDCl₃) δ (TMS, ppm): 150.51, 146.37, 142.75, 140.79, 138.72, 137.00, 135.62, 133.76, 133.12, 131.09, 129.88, 129.64, 126.98, 126.87, 126.31, 126.00, 124.67, 122.82, 120.53, 120.38, 116.67, 115.81, 108.85, 105.89. HRMS for C₃₅H₂₄N₄ [M]⁺, calculated: 501.2079; found: 501.2073.

4-((Z)-2-Cyano-2-(4-((Z)-1-cyano-2-(4-(diphenylamino)phenyl)vinyl)phenyl)vinyl)-1-ethylpyridin-1-ium (TPAPF₆): Similar to the synthesis of TPEPF₆, except that the starting materials were compound **9** (250.2 mg, 0.5 mmol) and iodoethane (58.0 μ L, 0.6 mmol). The crude product was washed with ethyl acetate to give TPAPF₆ as a black solid. Yield: 240.8 mg, 91.0%. ¹H NMR (400 MHz, DMSO-*d*₆) δ (TMS, ppm): 9.20 (d, *J* = 6.8 Hz, 2H), 8.48 (d, *J* = 6.7 Hz, 2H), 8.41 (s, 1H), 8.10 (s, 1H), 7.95 (dt, *J* = 16.7, 8.9 Hz, 6H), 7.42 (t, *J* = 7.8 Hz, 4H), 7.20 (dd, *J* = 16.3, 7.9 Hz, 6H), 6.97 (d, *J* = 8.9 Hz, 2H), 4.65 (q, *J* = 7.3 Hz, 2H), 1.59 (t, *J* = 7.3 Hz, 3H). ¹³C NMR (150 MHz, DMSO-*d*₆) δ (TMS, ppm): 149.97, 145.80, 145.26, 135.20, 131.22, 129.93, 128.39, 127.49, 127.11, 126.19, 125.82, 124.96, 119.48, 83.89, 24.61. HRMS for C₃₇H₂₉N₄⁺ [M-PF₆], calculated: 529.2392; found: 529.2392.

(Z)-2-(4-(Cyanomethyl)phenyl)-3-(4-(diethylamino)phenyl)acrylonitrile (10): Similar to the synthesis of compound **5**, except that the starting materials were compound **1** (468.2 mg, 3.0 mmol) and compound **4** (117.1 mg, 1.0 mmol). The crude product was purified by silica-gel column chromatography using petroleum ether/ethyl acetate (v/v, 15/1) as eluent to obtain the desired product as orange-yellow solid (129.8 mg, 41.2%). ¹H NMR (400 MHz, CDCl₃) δ (TMS, ppm): 7.85 (d, *J* = 8.6 Hz, 2H), 7.63 (d, *J* = 8.2 Hz, 2H), 7.40 (q, *J* = 16.1, 8.0 Hz, 4H), 7.26 (s, 1H),

3.78 (s, 2H), 3.43 (q, $J = 7.0$ Hz, 4H), 1.22 (t, $J = 7.1$ Hz, 6H). Please noted that due to the poor solubility of compound **10**, as suggested by the ^1H NMR measurement, we did not obtain the pure compound **10**. We have to use this not pure enough compound **10** as one of the raw material for the synthesis of compound **11** which is the intermediate of the targeted compound DEAPF₆.

(Z)-2-(4-((Z)-1-Cyano-2-(4-(diethylamino)phenyl)vinyl)phenyl)-3-(pyridin-4-yl)acrylonitrile (11): Similar to the synthesis of compound **7**, except that the starting materials were compound **10** (157.1 mg, 0.5 mmol) and compound **6** (57.3 μL , 0.6 mmol). The crude product was purified by silica-gel column chromatography using petroleum ether/ethyl acetate (v/v, 2/1) as eluent to obtain compound **11** as red solid. Yield: 162.1 mg, 80.2%. ^1H NMR (400 MHz, DMSO- d_6) δ (TMS, ppm): 8.77 (d, $J = 5.7$ Hz, 2H), 8.17 (s, 1H), 7.93–7.81 (m, 9H), 6.81 (d, $J = 9.0$ Hz, 2H), 3.45 (q, $J = 7.0$ Hz, 4H), 1.19–1.07 (m, 6H). HRMS for C₂₇H₂₄N₄ [M]⁺, calculated:405.2079; found: 405.2077.

4-((Z)-2-Cyano-2-(4-((Z)-1-cyano-2-(4-(diethylamino)phenyl)vinyl)phenyl)vinyl)-1-ethylpyridin-1-ium (DEAPF₆): Similar to the synthesis of TPEPF₆, except that the starting materials were compound **11** (202.1 mg, 0.5 mmol) and iodoethane (58.0 μL , 0.6 mmol). The crude product was washed with ethyl acetate to give DEAPF₆ as a black solid (193.2 mg, 89.2%). ^1H NMR (400 MHz, DMSO- d_6) δ (TMS, ppm): 9.20 (d, $J = 6.8$ Hz, 2H), 8.47 (d, $J = 6.8$ Hz, 2H), 8.38 (s, 1H), 8.10–7.80 (m, 7H), 6.82 (d, $J = 9.1$ Hz, 2H), 4.65 (q, $J = 7.3$ Hz, 2H), 3.46 (q, $J = 6.9$ Hz, 4H), 1.58 (t, $J = 7.3$ Hz, 3H), 1.24–1.05 (m, 6H). ^{13}C NMR (150 MHz, DMSO- d_6) δ (TMS, ppm): 149.75, 148.83, 144.89, 137.83, 132.11, 131.05, 127.37, 126.66, 125.55, 119.83, 119.13, 118.81, 116.08, 111.08, 99.80, 56.23, 43.86, 16.06, 12.47. HRMS for C₂₉H₂₉N₄⁺ [M-PF₆], calculated:433.2392; found: 433.2384.

To address the AIE effect in aqueous solution, we have carried out a series of experiments.

Firstly, we used the biocompatible DMSO and water to construct the binary solvent system. In this solvent system, DMSO is supposed to be a good solvent to the AIE-PSs developed in our work and water is supposed to be a relatively poorer solvent. However, as depicted in Fig. S31, the fluorescence of all these three compounds is not monotonously increased with the increase of water fraction (f_w). To figure out the reason for this phenomenon, we carried out the DLS measurements of TPEPF₆, TPAPF₆ and DEAPF₆ in the DMSO/water mixtures with different water fractions (Fig.s S32–S34). It is clearly that the DLS results are well consistent with the fluorescence spectra. In the DMSO/water mixtures with water fractions of 0% and 10%, the particle sizes of all these three compounds cannot be detected by DLS, suggesting their good solubility in DMSO. Moreover, in the DMSO/water mixtures with water fractions of 80%, 90% and 99%, the particle sizes of all these three compounds also cannot be detected by DLS, suggesting their good water miscibility and high solubility in the mixtures of DMSO/water with high water fractions. This is because that the three molecules developed by us all have a π -conjugated skeleton with cationic group, which makes the compounds amphiphilic. Combining the results of fluorescence and DLS measurements, it can be seen that for each compound, the larger aggregate size corresponds to stronger fluorescence, suggesting the AIE properties.

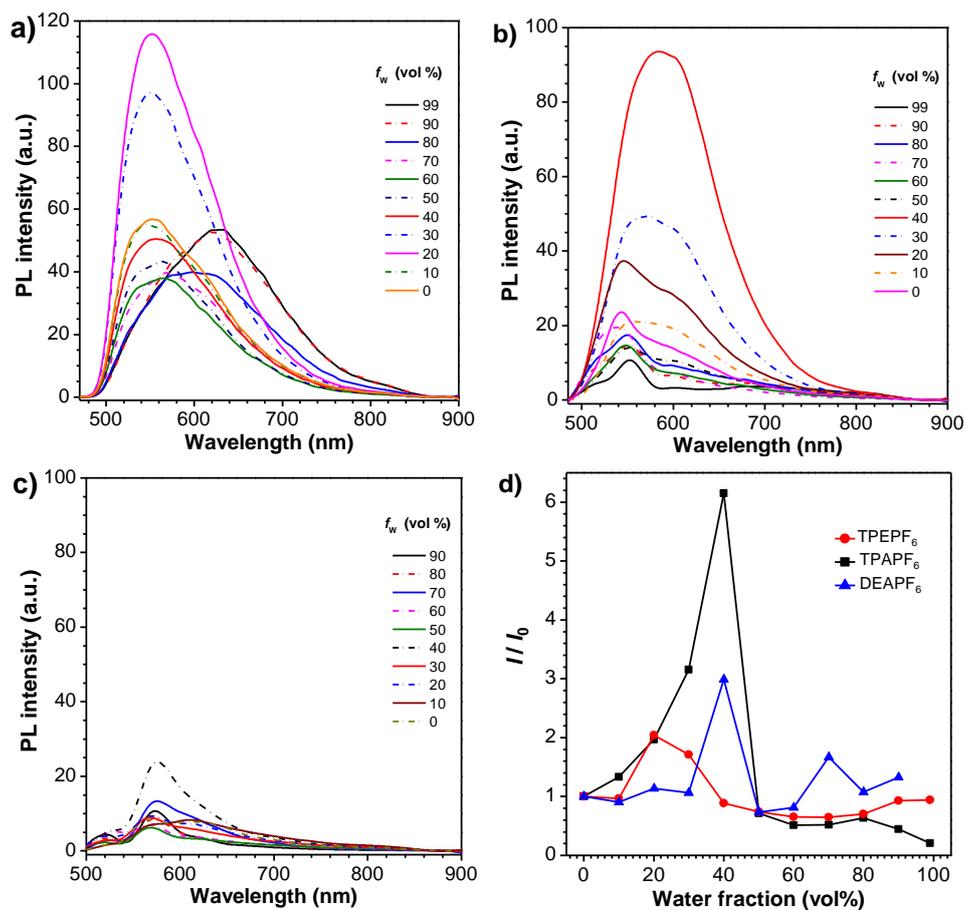

Fig. S31 a), b) and c) The fluorescence spectra of a) TPEPF₆, b) TPAPF₆ and c) DEAPF₆ in the DMSO/water mixtures with different water fractions (f_w). $\lambda_{ex} = 400$ nm for TPEPF₆; $\lambda_{ex} = 465$ nm for TPAPF₆; $\lambda_{ex} = 475$ nm for DEAPF₆; $c = 10$ μ M. d) The plots of I/I_0 of TPEPF₆, TPAPF₆, and DEAPF₆ in the DMSO/water mixtures *versus* the fractions of water.

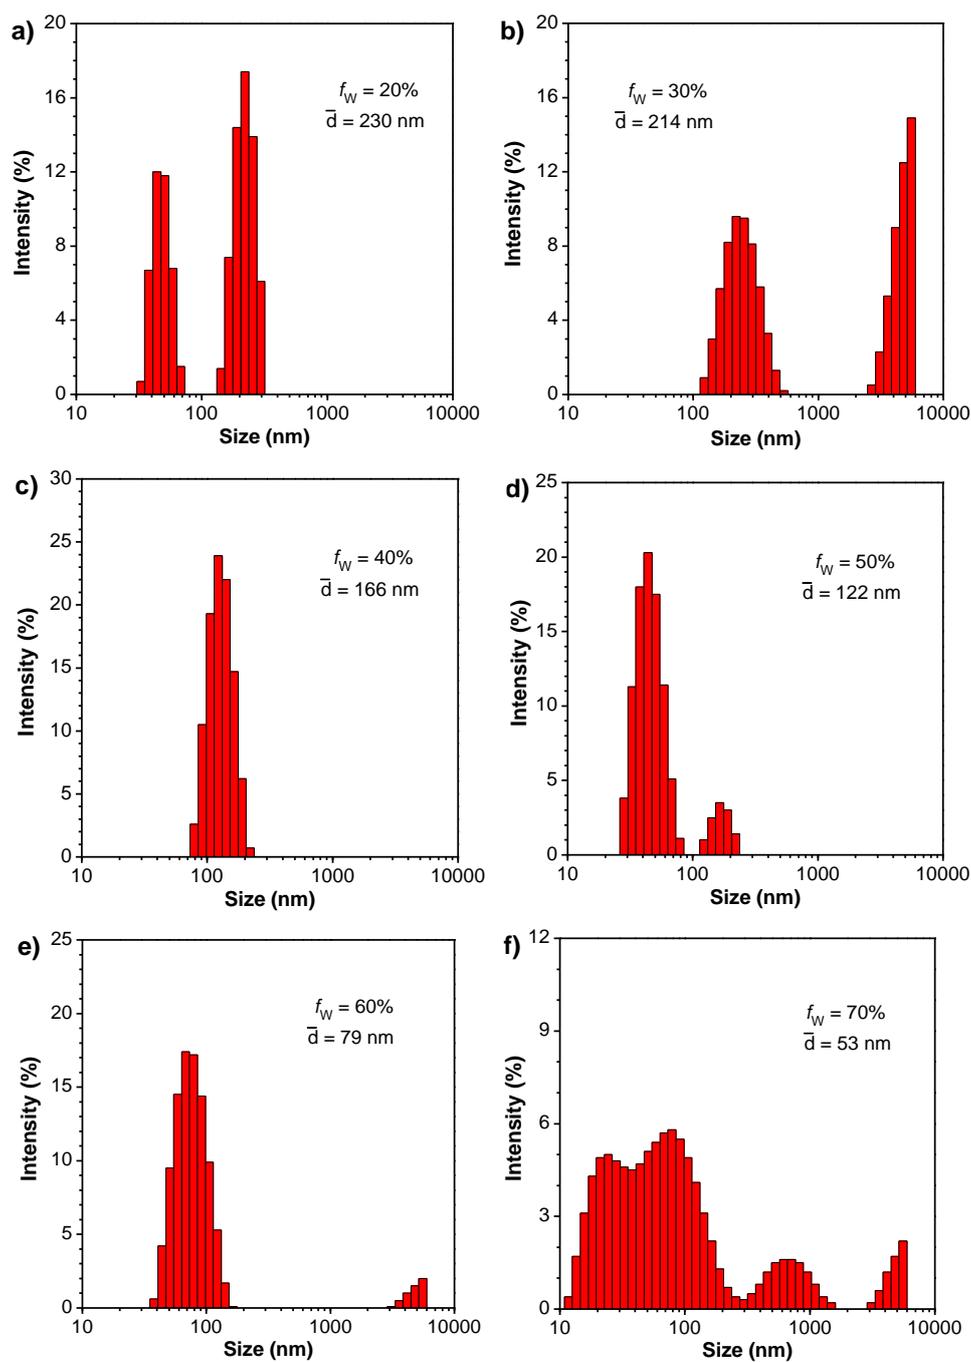

Fig. S32 Size distribution of TPEPF₆ in DMSO/water mixtures with different water fractions (f_w s), measured by dynamic light scattering (DLS).

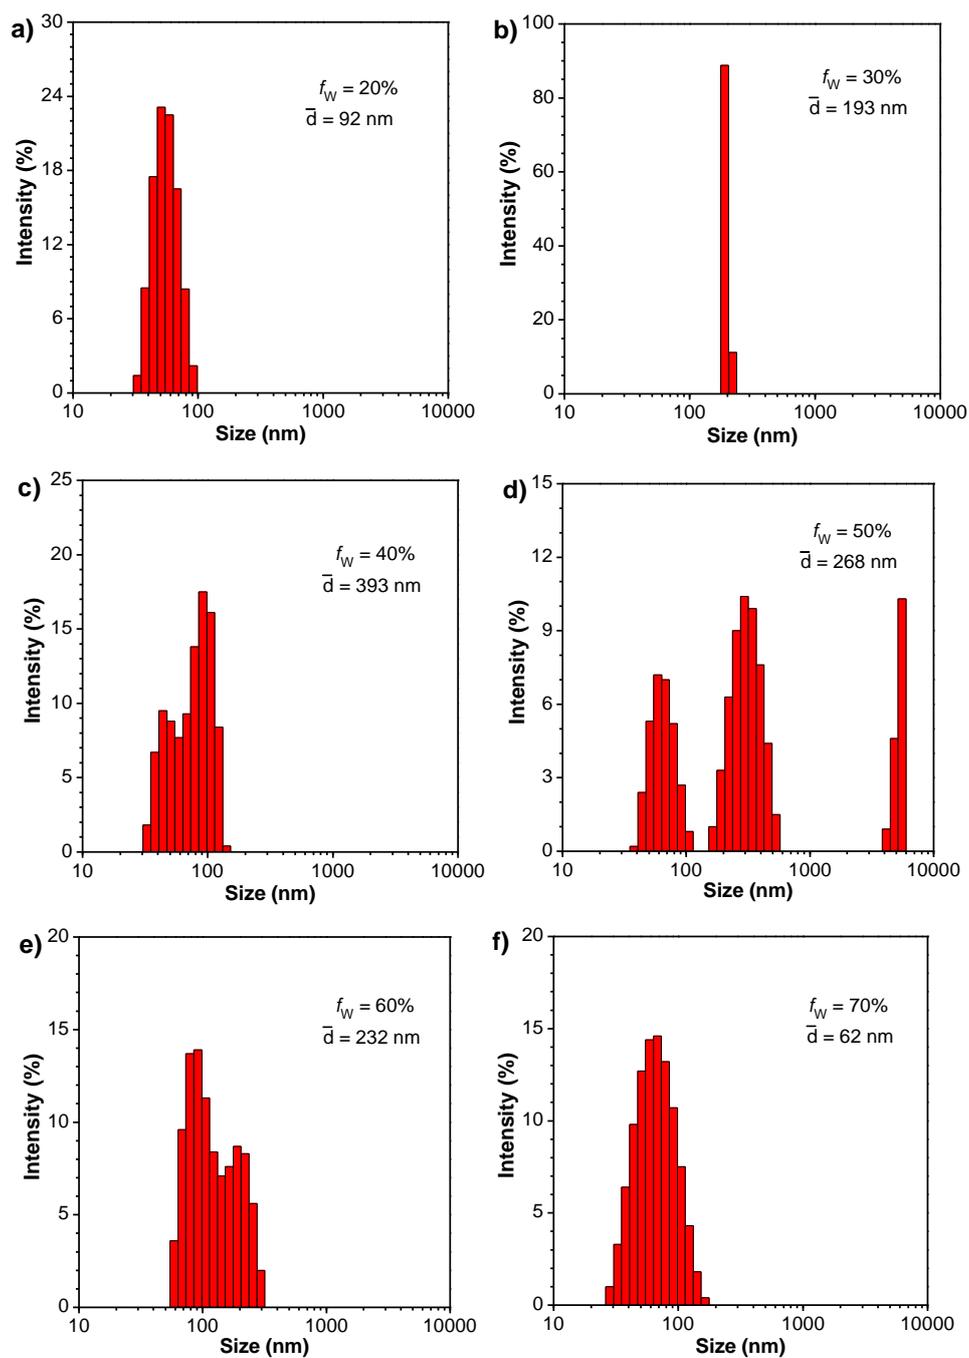

Fig. S33 Size distribution of TPAPF₆ in DMSO/water mixtures with different water fractions (f_w), measured by dynamic light scattering (DLS).

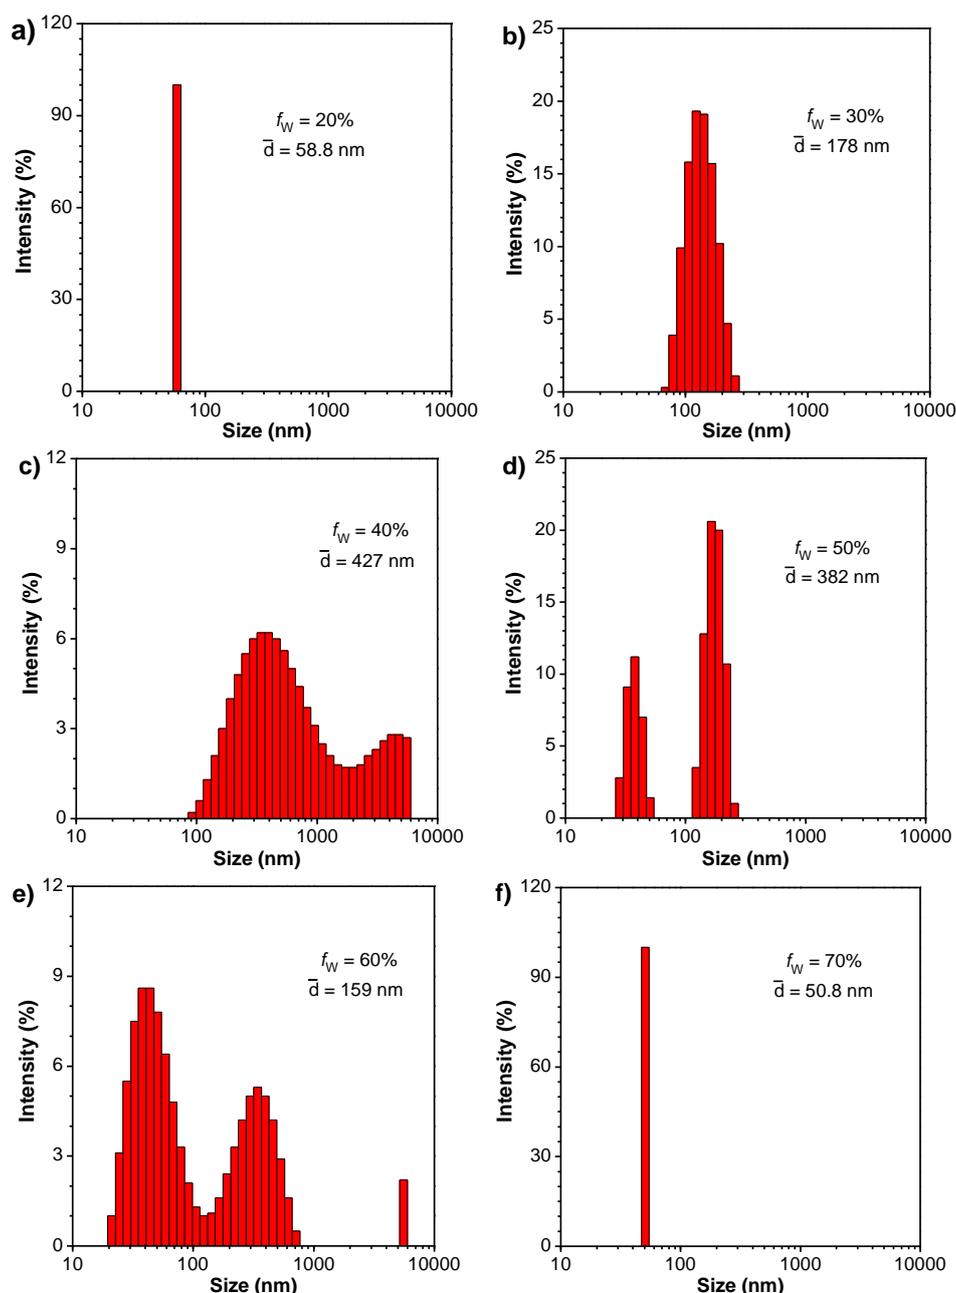

Fig. S34 Size distribution of DEAPF₆ in DMSO/water mixtures with different water fractions (f_w s), measured by dynamic light scattering (DLS).

To achieve a more direct demonstration of the AIE properties of our compounds in aqueous solution, we implemented the investigation on the fluorescence behaviors and the size distributions of these three compounds in the mixtures of DMSO/water ($v/v = 1/99$) with different compound concentrations (10, 20, 40, 60, 80, and 100 μM ; Fig.s S35–S40). As we know, high concentration is prone to result in aggregation. As shown in Fig.s S35, S37 and S39, the fluorescence of all these three compounds gets intensified by the increase of compound concentration. Such a phenomenon is proved to be associated with the AIE effect with the aid of the DLS results displayed in Fig.s S36, S38 and S40. It should be noted that at a concentration of 10 or 20 μM (TPEPF₆ and DEAPF₆) or 10, 20, 40 μM (TPAPF₆), the average diameters of all the three compounds in the DMSO/water mixtures (1/99, v/v) cannot be detected by the DLS. While the concentration reaches 40 μM (TPEPF₆ and DEAPF₆) and 60 μM (TPAPF₆), nanoaggregates or even microaggregates are detected. As the compound concentration increases, the average

diameter grows larger, and the fluorescence gets stronger, clearly demonstrating the AIE feature of these compounds.

It thus can be concluded that the AIE properties are the inherent attribute of our PSs.

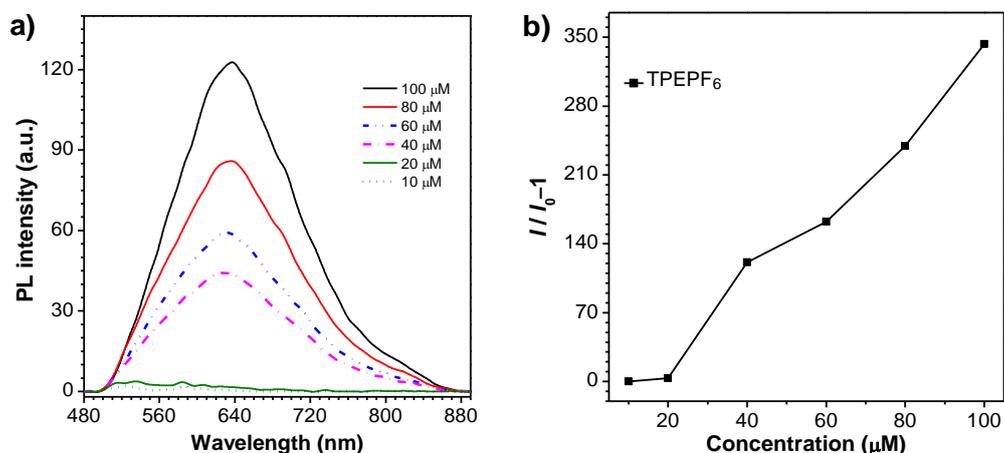

Fig. S35 a) The fluorescence spectra of TPEPF₆ in the DMSO/water mixtures (1/99, v/v) with different concentrations of TPEPF₆. b) The plot of $I/I_0 - 1$ of TPEPF₆ in the DMSO/water mixtures (1/99, v/v) versus the concentration of TPEPF₆.

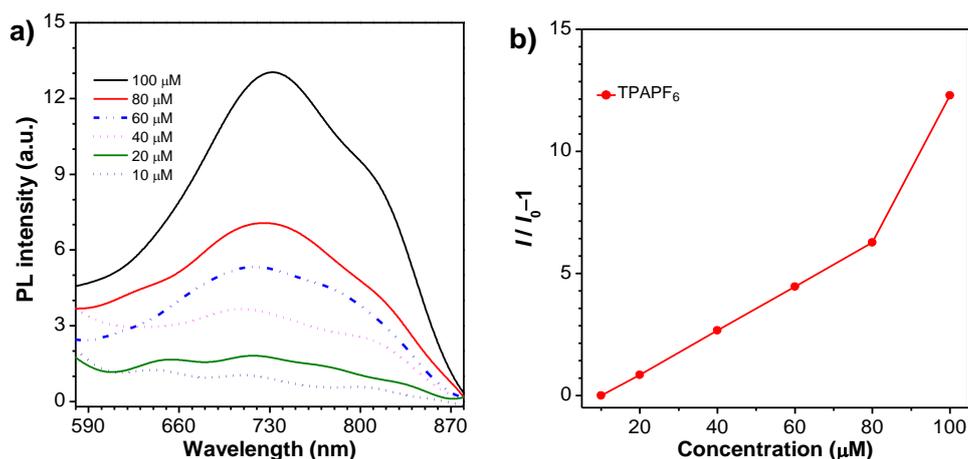

Fig. S37 a) The fluorescence spectra of TPAPF₆ in the DMSO/water mixtures (1/99, v/v) with different concentrations of TPAPF₆. b) The plot of I/I_0-1 of TPAPF₆ in the DMSO/water mixtures (1/99, v/v) versus the concentration of TPAPF₆.

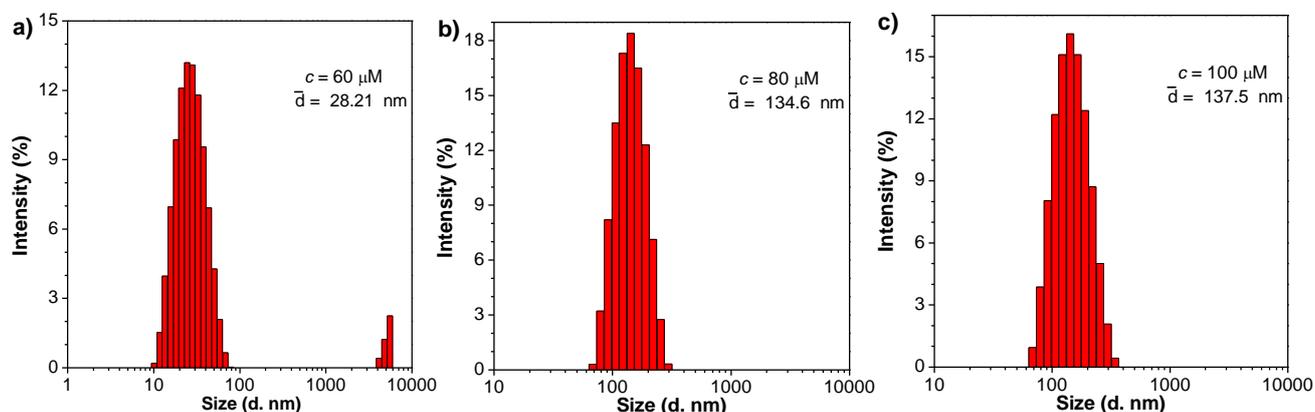

Fig. S38 Size distribution of TPAPF₆ in the DMSO/water mixtures (1/99, v/v) with different concentrations of TPAPF₆, measured by dynamic light scattering (DLS).

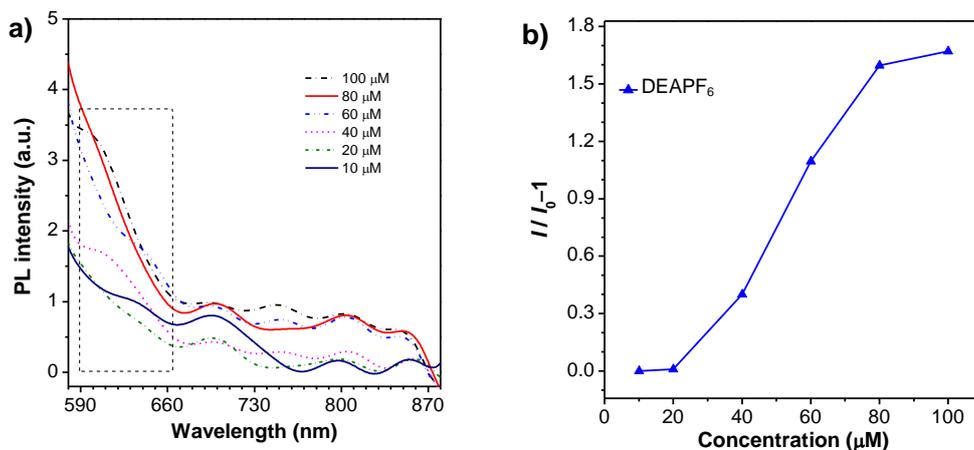

Fig. S39 a) The fluorescence spectra of DEAPF₆ in the DMSO/water mixtures (1/99, v/v) with different concentrations of DEAPF₆. b) The plots of I/I_0-1 of DEAPF₆ in the DMSO/water mixtures (1/99, v/v) versus the concentration of DEAPF₆.

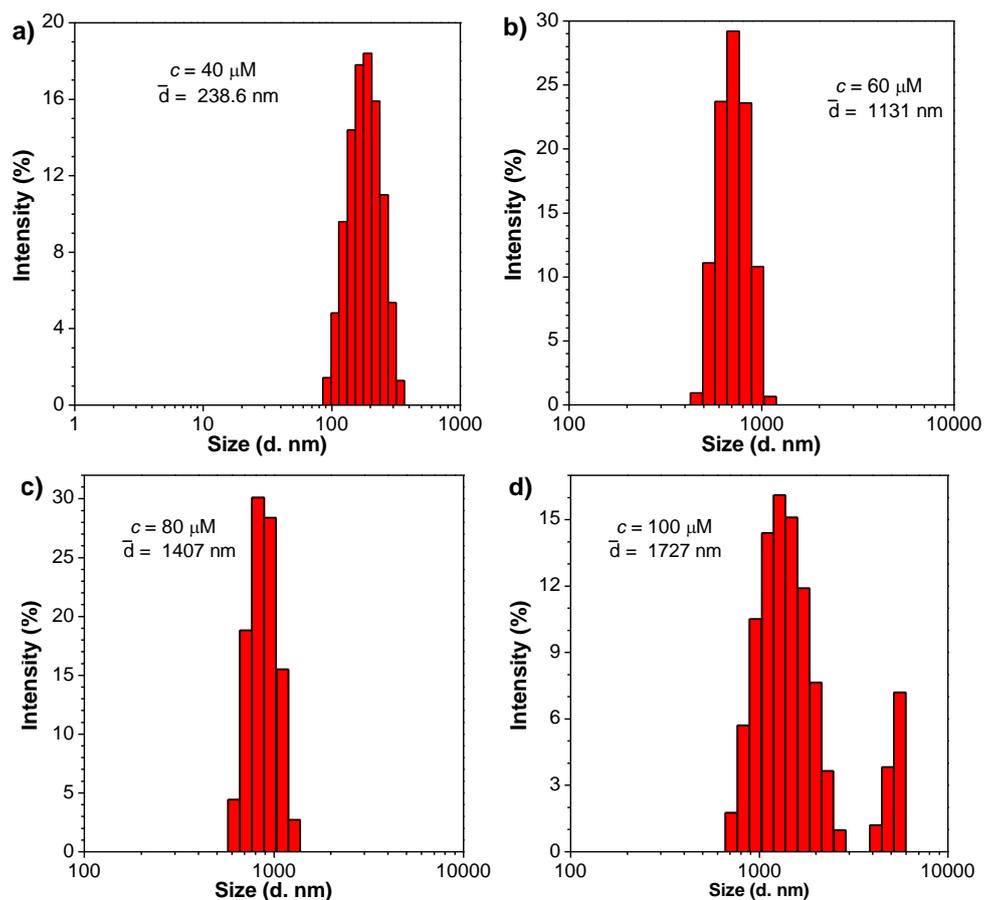

Fig. S40 Size distribution of DEAPF₆ in the DMSO/water mixtures (1/99, v/v) with different concentrations of DEAPF₆, measured by dynamic light scattering (DLS).

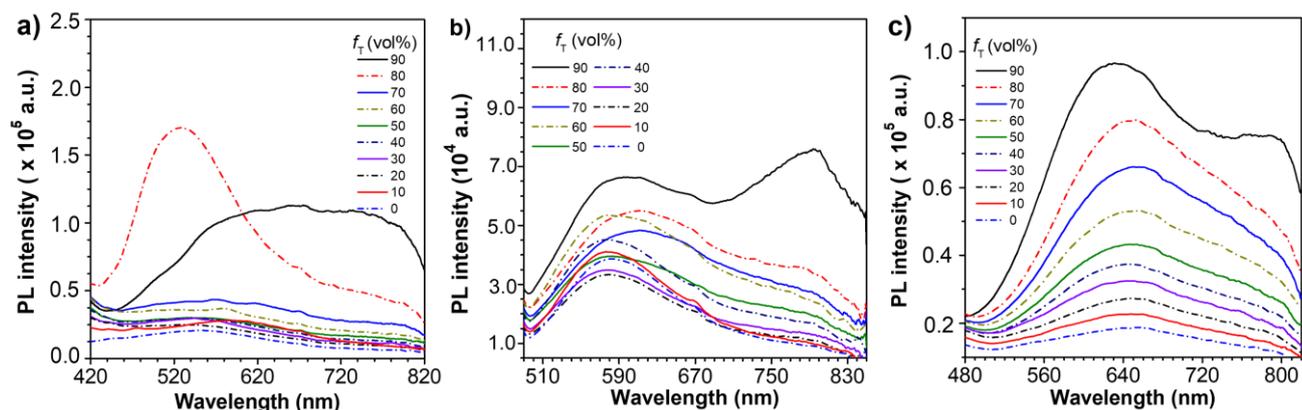

Fig. S41 FL spectra of a) TPEPF₆, b) TPAPF₆ and c) DEAPF₆ in the DMSO/toluene mixtures with different toluene fractions (f_T). $\lambda_{\text{ex}} = 400 \text{ nm}$ for TPEPF₆; $\lambda_{\text{ex}} = 465 \text{ nm}$ for TPAPF₆; $\lambda_{\text{ex}} = 475 \text{ nm}$ for DEAPF₆; $c = 10 \mu\text{M}$.

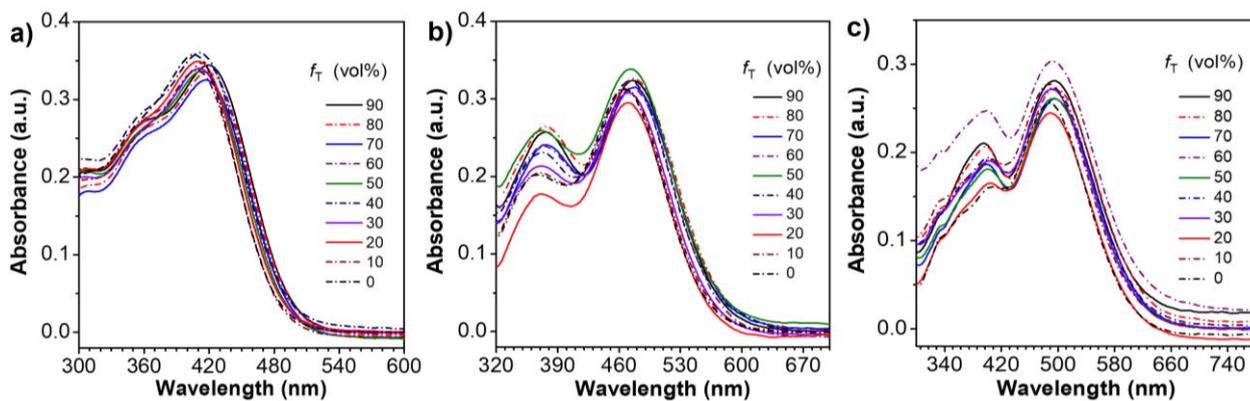

Fig. S42 The UV-Vis spectra of a) TPEPF₆, b) TPAPF₆, and c) DEAPF₆ in the DMSO/toluene mixtures with different toluene fractions (f_T), $c = 10 \mu\text{M}$.

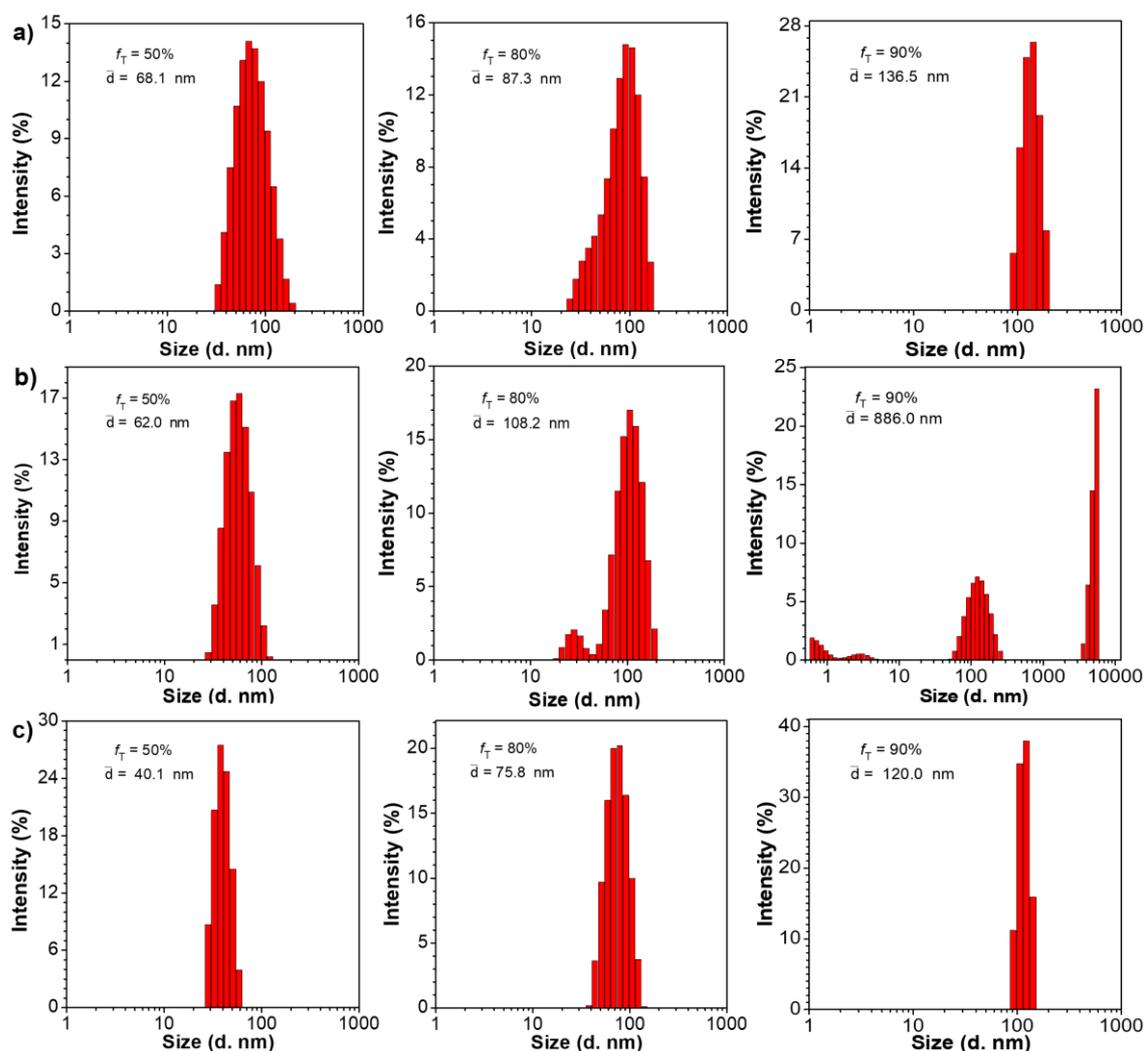

Fig. S43 Size distribution of a) TPEPF₆, b) TPAPF₆, and c) DEAPF₆ in DMSO/toluene with different toluene fractions (f_T), measured by dynamic light scattering (DLS).

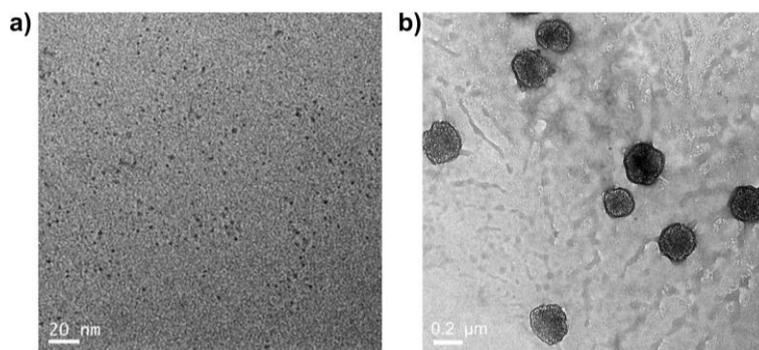

Fig. S44 TEM images of TPEPF₆ in DMSO/toluene with different toluene fractions (f_T s). a) $f_T = 80$ vol%, b) $f_T = 90$ vol%.

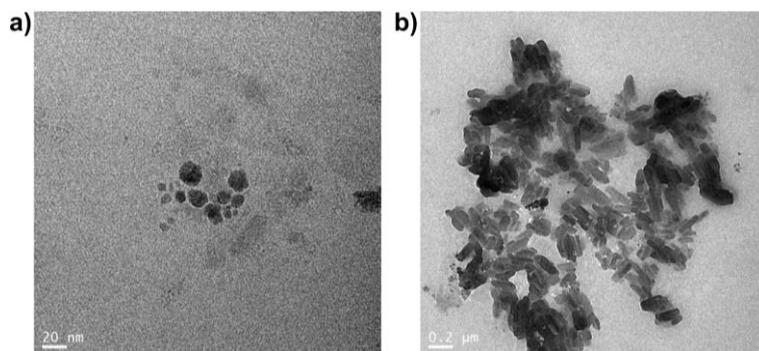

Fig. S45 TEM images of TPAPF₆ in DMSO/toluene with different toluene fractions (f_T s). a) $f_T = 80$ vol%, b) $f_T = 90$ vol%.

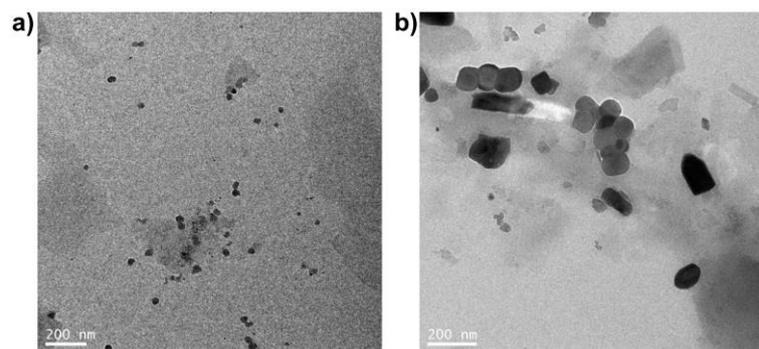

Fig. S46 TEM images of DEAPF₆ in DMSO/toluene with different toluene fractions (f_T s). a) $f_T = 80$ vol%, b) $f_T = 90$ vol%.

The average hydrodynamic diameters of the aggregates formed by TPEPF₆, TPAPF₆, and DEAPF₆ in the mixtures of DMSO/toluene (v/v, 1/9) are about 137, 886, and 120 nm, respectively, as indicated by DLS (Fig. S33). Obvious aggregate formation can be clearly seen in TEM images (Fig. S34–S36), which is in good agreement with the DLS data.

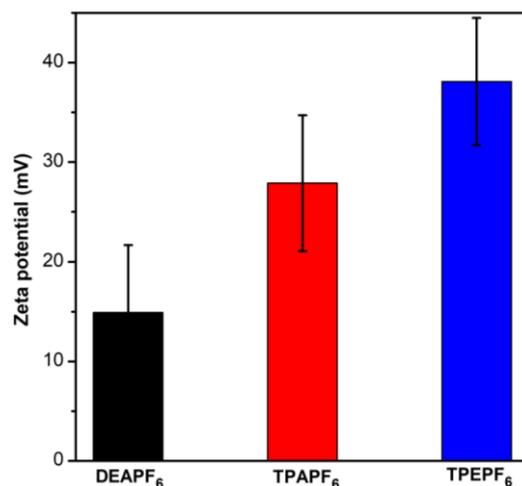

Fig. S47 Zeta potential of TPEPF₆, TPAPF₆ and DEAPF₆ characterized by DLS in aqueous solution (containing 1 vol% DMSO).

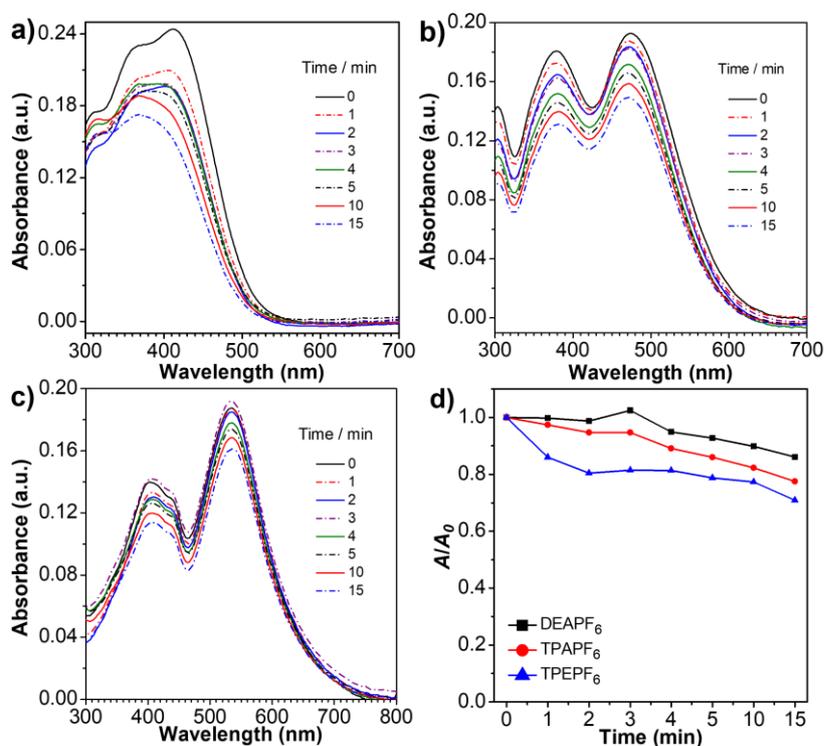

Fig. S48 UV-Vis absorption spectra of a) TPEPF₆, b) TPAPF₆ and c) DEAPF₆ after being irradiated for different time by white light (25 mW/cm²). d) Plots of the relative absorbance of these three AIE-PSs under white-light irradiation, where A_0 and A is the absorbance before and after light irradiation, respectively.

Table S4 Crystal data and structure refinement for TPAPF₆.

Compound name	TPAPF ₆	
CCDC number	No. 2165738	
Empirical formula	C _{38.50} H ₃₇ F ₆ N _{6.50} OP	
Formula weight	751.71	
Temperature	296 K	
Wavelength	1.54178 Å	
Crystal system	Triclinic	
Space group	P-1	
Cell parameters	$a = 13.844(3) \text{ \AA}$	$\alpha = 83.878(14)^\circ$
	$b = 14.078(3) \text{ \AA}$	$\beta = 87.451(14)^\circ$
	$c = 20.216(5) \text{ \AA}$	$\gamma = 75.021(14)^\circ$
Volume	3783.8(16) Å ³	
Z	4	
Density (calculated)	1.320 mg/m ³	
Absorption coefficient	1.246 mm ⁻¹	
F(000)	1562.0	
Crystal size	0.4 × 0.2 × 0.1 mm ³	
Theta range for data collection	3.3 to 67.4°	
Index ranges	-16 ≤ h ≤ 16, -16 ≤ k ≤ 16, -23 ≤ l ≤ 23	
Reflections collected	12711	
Independent reflections	12711 [R(int) = 0.058]	
Completeness of data	98.6 %	
Absorption correction	Multi-scan ($\theta_{\max} = 65.1^\circ$, $\theta_{\min} = 2.2^\circ$)	
Max. and min. transmission	0.633 and 0.753	
Refinement method	Full-matrix least-squares on F^2	
Final R indices [I > 2σ(I)]	R = 0.0999, wR2 = 0.0.3054	
Largest diff. peak and hole	0.55 and -0.43 e. Å ⁻³
