Crystallographic Data and Structural Refinements	S6
Table S1. Crystallographic Data and Structural Refinement of $[(\text{Cp}^*_2\text{Gd})_2(\mu\text{-Bbim})] \cdot x$ toluene, 1-Ln (Ln = Gd, Tb, x = 2; Ln = Dy, x = 1).	S6
Figure S1. Structure of 1-Gd .	S7
Figure S2. Structure of 1-Tb .	S7
Table S2. Crystallographic Data and Structural Refinement of $[\text{K}(\text{crypt-222})][(\text{Cp}^*_2\text{Ln})_2(\mu\text{-Bbim}^*)] \cdot 3 \text{ THF}$, 2-Ln (Ln = Gd, Tb, Dy).	S7
Figure S3. Structure of the $[(\text{Cp}^*_2\text{Gd})_2(\mu\text{-Bbim}^*)]^-$ anion in a crystal of 2-Gd .	S8
Figure S4. Structure of the $[(\text{Cp}^*_2\text{Tb})_2(\mu\text{-Bbim}^*)]^-$ anion in a crystal of 2-Tb .	S8
Figure S5. Packing diagram of the anions in a crystal of 2-Gd .	S9
Figure S6. Packing diagram of the anions in a crystal of 2-Tb .	S10
Figure S7. Packing diagram of the anions in a crystal of 2-Dy .	S11
IR Spectroscopy	S12
Figure S8. FTIR spectra of $[(\text{Cp}^*_2\text{Gd})_2(\mu\text{-Bbim})]$, 1-Gd (blue) and $[\text{K}(\text{crypt-222})][(\text{Cp}^*_2\text{Gd})_2(\mu\text{-Bbim}^*)]$, 2-Gd , (red).	S12
Figure S9. FTIR spectra of $[(\text{Cp}^*_2\text{Tb})_2(\mu\text{-Bbim})]$, 1-Tb (blue) and $[\text{K}(\text{crypt-222})][(\text{Cp}^*_2\text{Tb})_2(\mu\text{-Bbim}^*)]$, 2-Tb , (red).	S12
Figure S10. FTIR spectra of $[(\text{Cp}^*_2\text{Dy})_2(\mu\text{-Bbim})]$, 1-Dy (blue) and $[\text{K}(\text{crypt-222})][(\text{Cp}^*_2\text{Dy})_2(\mu\text{-Bbim}^*)]$, 2-Dy , (red).	S13
Figure S11. Stacked FTIR spectra of $[(\text{Cp}^*_2\text{Ln})_2(\mu\text{-Bbim})]$, 1-Ln (Ln = Y(gray), Gd (turquoise), Tb (pink), Dy (blue)).	S13
Figure S12. Stacked FTIR spectra $[\text{K}(\text{crypt-222})][(\text{Cp}^*_2\text{Dy})_2(\mu\text{-Bbim}^*)]$, 2-Ln (Ln = Y (gray), Gd (turquoise), Tb (pink), Dy (blue)).	S14
UV/Vis Spectroscopy	S15
Figure S13. UV/Vis spectra of $[(\text{Cp}^*_2\text{Ln})_2(\mu\text{-Bbim})]$ (1-Ln) and $[\text{K}(\text{crypt-222})][(\text{Cp}^*_2\text{Ln})_2(\mu\text{-Bbim}^*)]$ (2-Ln), Ln = Gd (left) and Tb (right).	S15
Figure S14. Superimposed UV/Vis spectra of $[(\text{Cp}^*_2\text{Ln})_2(\mu\text{-Bbim})]$ (1-Ln , Y, Gd, Tb, Dy)	S15
Figure S15. Superimposed UV/Vis spectra of $[\text{K}(\text{crypt-222})][(\text{Cp}^*_2\text{Ln})_2(\mu\text{-Bbim}^*)]$ (2-Ln , Y, Gd, Tb, Dy)	S16
Cyclic Voltammetry	S17
Figure S16. Full cyclic voltammogram of $[\text{K}(\text{crypt-222})][(\text{Cp}^*_2\text{Dy})_2(\mu\text{-Bbim}^*)]$, 2-Dy , in THF.	S17
Magnetism	S18
Figure S17. Variable-temperature dc magnetic susceptibility data of 2-Dy , 2-Tb and 2-Gd collected under a 1 T applied dc field.	S18
Figure S18. Variable-temperature dc magnetic susceptibility data of 2-Gd collected under a 0.1 T applied dc field with fits.	S19
Figure S19. Variable-temperature dc magnetic susceptibility data of 2-Gd collected under a 0.5 T applied dc field with fits.	S20
Figure S20. Variable-temperature dc magnetic susceptibility data of 2-Gd collected under a 1 T applied dc field with fits.	S21
Figure S21. Superimposed variable-temperature dc susceptibility data of 2-Gd collected under 0.1 T, 0.5 T, 1 T applied dc fields.	S22
Figure S22. Variable-temperature dc magnetic susceptibility data of 2-Dy collected under a 0.1 T applied dc field.	S22
Figure S23. Variable-temperature dc magnetic susceptibility data of 2-Dy collected under a 0.5 T applied dc field.	S23
Figure S24. Variable-temperature dc magnetic susceptibility data of 2-Dy collected under a 1 T applied dc field.	S23
Figure S25. Variable-temperature dc magnetic susceptibility data for a restrained polycrystalline sample of 1-Gd collected under a 0.1 T applied dc field.	S24

Figure S26. Variable-temperature dc magnetic susceptibility data for a restrained polycrystalline sample of 1-Gd collected under a 0.5 T applied dc field.	S25
Figure S27. Variable-temperature dc magnetic susceptibility data for a restrained polycrystalline sample of 1-Gd collected under a 1 T applied dc field.	S26
Figure S28. Variable-temperature dc magnetic susceptibility data for a restrained polycrystalline sample of 1-Gd collected under 0.1, 0.5, and 1 T applied dc fields.	S27
Figure S29. Enlarged plot of variable-temperature dc magnetic susceptibility data for a restrained polycrystalline sample of 1-Gd collected under 0.1, 0.5, and 1 T applied dc fields	S27
Figure S30. Variable-temperature dc magnetic susceptibility data for restrained polycrystalline samples of 1-Gd and 2-Gd collected under a 0.1 T applied dc field.	S28
Figure S31. Variable-temperature dc magnetic susceptibility data for restrained polycrystalline samples of 1-Dy , 1-Tb , 1-Gd , 2-Dy , 2-Tb , and 2-Gd collected under a 0.1 T applied dc field.	S28
Figure S32. Variable-temperature dc magnetic susceptibility data for a restrained polycrystalline sample of 1-Tb collected under a 0.1 T applied dc field.	S29
Figure S33. Variable-temperature dc magnetic susceptibility data for a restrained polycrystalline sample of 1-Tb collected under a 0.5 T applied dc field.	S29
Figure S34. Variable-temperature dc magnetic susceptibility data for a restrained polycrystalline sample of 1-Tb collected under a 1 T applied dc field.	S30
Figure S35. Variable-temperature dc magnetic susceptibility data for a restrained polycrystalline sample of 1-Tb collected under 0.1, 0.5, and 1 T applied dc fields.	S30
Figure S36. Variable-temperature dc magnetic susceptibility data for restrained polycrystalline samples of 1-Tb and 2-Tb collected under a 0.1 T applied dc field.	S31
Figure S37. Variable-temperature dc magnetic susceptibility data for a restrained polycrystalline sample of 1-Dy collected under a 0.1 T applied dc field.	S31
Figure S38. Variable-temperature dc magnetic susceptibility data for a restrained polycrystalline sample of 1-Dy collected under a 0.5 T applied dc field.	S32
Figure S39. Variable-temperature dc magnetic susceptibility data for a restrained polycrystalline sample of 1-Dy collected under 0.1 and 0.5 T applied dc fields.	S32
Figure S40. Variable-temperature dc magnetic susceptibility data for restrained polycrystalline samples of 1-Dy and 2-Dy collected under a 0.5 T applied dc field.	S33
 Data derived from Ac Susceptibility Measurements	S34
Figure S41. Variable-temperature, variable-frequency in-phase (χ_M') and out-of-phase (χ_M'') ac magnetic susceptibility data of 2-Dy under a zero applied dc field from 5.5 to 11.5 K.	S34
Figure S42. Cole-Cole (Argand) plots for ac susceptibility collected from 4.5 to 11.5 K under zero applied dc field for 2-Dy .	S35
Figure S43. Arrhenius plots of relaxation time data for 2-Dy obtained between 4.5 and 11.5 K (see Figure 6 in the main text).	S35
Figure S44. Cole-Cole (Argand) plots for ac susceptibility collected from 5.5 to 11.5 K under zero applied dc field for 2-Dy with fits.	S36
Figure S45. Arrhenius plot of relaxation time data for 2-Dy between 5.5 and 11.5 K with linear fit to the Arrhenius equation.	S36
Figure S46. Variable-temperature, variable-frequency in-phase (χ_M') ac magnetic susceptibility data collected for 1-Dy under a zero applied dc field from 5.5 to 24.5 K.	S37
Figure S47. Cole-Cole (Argand) plots for ac susceptibility collected from 5.5 to 24.5 K under zero applied dc field for 1-Dy .	S37
Figure S48. Arrhenius plots of relaxation time data for 1-Dy obtained between 5.5 and 11.5 K through ac magnetic susceptibility measurements.	S38
Figure S49. Individual contributions of the multiple magnetic relaxation pathways to the Arrhenius plot of 1-Dy at 0 Oe.	S38
 Data derived from Dc Relaxation Experiments	S39
Figure S50. Plot of magnetization vs. time used to derive relaxation times for 2-Dy at 1.8 K with fit to a stretched exponential decay function.	S39

Figure S51. Plot of magnetization vs. time used to derive relaxation times for 2-Dy at 2.0 K with fit to a stretched exponential decay function.	S39
Figure S52. Plot of magnetization vs. time used to derive relaxation times for 2-Dy at 2.5 K with fit to a stretched exponential decay function.	S40
Figure S53. Plot of magnetization vs. time used to derive relaxation times for 2-Dy at 3.0 K with fit to a stretched exponential decay function.	S40
Figure S54. Plot of magnetization vs. time used to derive relaxation times for 2-Dy at 3.5 K with fit to a stretched exponential decay function.	S41
Figure S55. Plot of magnetization vs. time used to derive relaxation times for 2-Dy at 4.0 K with fit to a stretched exponential decay function.	S41
Figure S56. Plot of magnetization (normalized) vs. time used to derive relaxation times for 2-Dy at different temperatures with fits.	S42
Table S3. Relaxation times, τ (s), and stretch factors, b , at various temperatures, T (K) for 2-Dy .	S42
Figure S57. Individual contributions of the multiple magnetic relaxation pathways to the Arrhenius plot of 2-Dy at 0 Oe.	S43
Figure S58. Arrhenius plots of relaxation time data derived from ac magnetic susceptibility measurements at temperatures from 4.5 to 11.5 K and dc relaxation experiments within the temperature range of 1.8 to 4 K for 2-Dy with fits.	S44
Table S4. Best-fit parameters for the Arrhenius plot of 2-Dy at $H_{dc} = 0$ Oe.	S45
Figure S59. Plot of magnetization vs. time used to derive relaxation times for 1-Dy at 1.8 K.	S45
Figure S60. Plot of magnetization vs. time used to derive relaxation times for 1-Dy at 2 K.	S46
Figure S61. Plot of magnetization vs. time used to derive relaxation times for 1-Dy at 2.2 K.	S46
Figure S62. Plot of magnetization vs. time used to derive relaxation times for 1-Dy at 2.5 K.	S47
Figure S63. Plot of magnetization vs. time used to derive relaxation times for 1-Dy at 2.75 K.	S47
Figure S64. Plot of magnetization vs. time used to derive relaxation times for 1-Dy at 3 K.	S48
Figure S65. Plot of magnetization vs. time used to derive relaxation times for 1-Dy at 3.25 K.	S48
Figure S66. Plot of magnetization vs. time used to derive relaxation times for 1-Dy at 3.5 K.	S49
Figure S67. Plot of magnetization vs. time used to derive relaxation times for 1-Dy at 4 K.	S49
Figure S68. Plot of magnetization vs. time used to derive relaxation times for 1-Dy at 4.5 K.	S50
Figure S69. Plot of magnetization (normalized) vs. time used to derive relaxation times for 1-Dy at different temperatures.	S50
Table S5. Relaxation times, τ (s), and stretch factors, b , at various temperatures, T (K) for 1-Dy .	S51
Figure S70. Individual contributions of the multiple magnetic relaxation pathways to the Arrhenius plot of 1-Dy at 0 Oe.	S52
Table S6. Best-fit parameters for the Arrhenius plot of 1-Dy at $H_{dc} = 0$ Oe.	S52
Figure S71. Comparison of all relaxation times data derived from ac magnetic susceptibility measurements and dc relaxation experiments for 1-Dy and 2-Dy ,	S53

CASSCF Calculations **S54**

Table S7. Computed energy levels and main components of the wavefunction for each m_j state of the ground-state multiplet 7F_6 for first individual Tb center of 2-Tb .	S54
Table S8. Computed energy levels and main components of the wavefunction for each m_j state of the ground-state multiplet 7F_6 for second individual Tb center of 2-Tb .	S54
Figure S72. Temperature dependent $\chi_M T$ values for 2-Tb in dots with the calculated curves in full lines for a screening of the J_{ex}^{fit} values from -1.5 cm^{-1} to -0.5 cm^{-1} .	S55
Figure S73. Temperature dependent $\chi_M T$ values for 2-Tb in dots with the best calculated curve in full line.	S55

Table S9. Computed energy levels (the ground state is set at zero) and composition of the g -tensor (g_x, g_y, g_z) of the low-lying exchange energy levels for 2-Tb .	S56
Figure S74. Isosurfaces (± 0.045) of computed active molecular orbitals of the sextet state of 2-Tb at the CAS(9,8)SCF level.	S56
Table S10. Computed energy levels, composition of the g -tensor (g_x, g_y, g_z) and main components of the wavefunction for each m_j state of the ground-state multiplet ${}^6\text{H}_{15/2}$ for first individual Dy center of 2-Dy .	S57
Table S11. Computed energy levels, composition of the g -tensor (g_x, g_y, g_z) and main components of the wavefunction for each m_j state of the ground-state multiplet ${}^6\text{H}_{15/2}$ for second individual Dy center of 2-Dy .	S57
Figure S75. Variable-temperature dc magnetic susceptibility data for 2-Dy in dots with the calculated curves in full lines for a screening of the $J_{\text{ex}}^{\text{fit}}$ value from -4.5 cm^{-1} to -2.5 cm^{-1} .	S58
Figure S76. Variable-temperature dc magnetic susceptibility data of 2-Dy with the best for $J_{\text{ex}}^{\text{fit}} = -3.5 \text{ cm}^{-1}$.	S58
Table S12. Computed energy levels (the ground state is set at zero) and composition of the g -tensor (g_x, g_y, g_z) of the low-lying exchange energy levels for 2-Dy .	S59
Figure S77. Isosurfaces (± 0.045) of computed active molecular orbitals of the quintet state of 2-Dy at the CAS(10,8)SCF level.	S59
Table S13. Computed energy difference (ΔE) and exchange coupling constant ($J_{\text{ex}}^{\text{calc}}$) for 2-Tb and 2-Dy .	S60
Figure S78. Low-lying exchange spectra calculated in 2-Tb and 2-Dy .	S60
Figure S79. Isosurfaces (± 0.045) of computed active molecular orbitals of the sextet state of 2-Gd at the CAS(8,8)SCF level	S61
Figure S80. Ground state magnetic anisotropy axes representation projected on molecular structures for 2-Dy at the CAS(9,7)SCF level	S62
Table S14. Computed energy levels (the ground state is set at zero), composition of the g -tensor (g_x, g_y, g_z) and main components ($>10\%$) of the wavefunction for each m_j state of the ground-state multiplet ${}^6\text{H}_{15/2}$ for first individual Dy center of 1-Dy .	S62
Table S15. Computed energy levels (the ground state is set at zero), composition of the g -tensor (g_x, g_y, g_z) and main components ($>10\%$) of the wavefunction for each m_j state of the ground-state multiplet ${}^6\text{H}_{15/2}$ for second individual Dy center of 1-Dy .	S63
Figure S81. Variable-temperature dc magnetic susceptibility data of 1-Dy (green squares) with the simulated curve (black solid line) for $J_{\text{ex}}^{\text{fit}} = 0.0 \text{ cm}^{-1}$.	S63
Figure S82. Schematic representation of the first two magnetic exchange energy levels of 2-Dy .	S64
Variable-Field Magnetization Measurements	S65
Figure S83. Magnification of variable-field magnetization data for 2-Dy at an average sweep rate of 100 Oe/s .	S65
Figure S84. Magnification of variable-field magnetization data for 2-Dy at an average sweep rate of 100 Oe/s .	S65
Figure S85. Variable temperature $M(H)$ curves for 2-Gd collected from 0 to 7 T.	S66
Figure S86. Variable temperature $M(H)$ curves for 2-Tb collected from 0 to 7 T.	S66
Figure S87. Variable temperature $M(H)$ curves for 2-Dy collected from 0 to 7 T.	S67
Figure S88. Variable-field magnetization (M) data for compound 1-Tb collected at 1.8 K at an average sweep rate of 0.01 T/s .	S67
Figure S89. Variable-field magnetization (M) data for compound 1-Dy collected from 1.8 to 5.0 K at an average sweep rate of 0.01 T/s .	S68
Figure S90. Magnification of variable-field magnetization data for 1-Dy at an average sweep rate of 100 Oe/s .	S68
Figure S91. Magnification of variable-field magnetization data for 1-Dy at an average sweep rate of 100 Oe/s .	S69
Figure S92. Variable temperature $M(H)$ curves for 1-Gd collected from 0 to 7 T.	S69
Figure S93. Variable temperature $M(H)$ curves for 1-Tb collected from 0 to 7 T.	S70
Figure S94. Variable temperature $M(H)$ curves for 1-Dy collected from 0 to 7 T.	S70

Additional Structural Comparison **S71**

Table S16. Comparison of bond metrics of $[(\text{Cp}^*_2\text{Ln})_2(\mu\text{-bpym}^*)]\text{BPh}_4$, $[(\text{Cp}^*_2\text{Ln})_2(\mu\text{-tppz}^*)]\text{BPh}_4$ and **2-Dy**. **S71**

Figure S3. Structure of the $[(\text{Cp}^*_2\text{Gd})_2(\mu\text{-Bbim}^*)]^-$ anion in a crystal of **2-Gd**. Orange, gray, and blue spheres represent gadolinium, carbon, and nitrogen atoms, respectively. All hydrogen atoms, THF solvent molecules and the $[\text{K}(\text{crypt-222})]^+$ counterion are omitted for clarity.

Figure S4. Structure of the $[(\text{Cp}^*_2\text{Tb})_2(\mu\text{-Bbim}^*)]^-$ anion in a crystal of **2-Tb**. Dark red, gray, and blue spheres represent terbium, carbon, and nitrogen atoms, respectively. All hydrogen atoms, THF solvent molecules and the $[\text{K}(\text{crypt-222})]^+$ counterion are omitted for clarity.

Figure S5. Packing diagram of the $[(\text{Cp}^*_2\text{Gd})_2(\mu\text{-Bbim}^*)]^-$ anions in a crystal of **2-Gd** in front (top) and top view (bottom). Orange, gray, and blue spheres represent gadolinium, carbon, and nitrogen atoms, respectively. All hydrogen atoms, THF solvent molecules and the $[\text{K}(\text{crypt-222})]^+$ counterion are omitted for clarity.

Figure S6. Packing diagram of the $[(\text{Cp}^*_2\text{Tb})_2(\mu\text{-Bbim}^*)]^-$ anions in a crystal of **2-Tb** in front (top) and top view (bottom). Red, gray, and blue spheres represent terbium, carbon, and nitrogen atoms, respectively. All hydrogen atoms, THF solvent molecules and the $[\text{K}(\text{crypt-222})]^+$ counterion are omitted for clarity.

Figure S7. Packing diagram of the $[(\text{Cp}^*_2\text{Dy})_2(\mu\text{-Bbim}^*)]^-$ anions in a crystal of **2-Dy** in front (top) and top view (bottom). Green, gray, and blue spheres represent dysprosium, carbon, and nitrogen atoms, respectively. All hydrogen atoms, THF solvent molecules and the $[\text{K}(\text{crypt-222})]^+$ counterion are omitted for clarity.

IR Spectroscopy

Figure S8. FTIR spectra of $[(\text{Cp}^*\text{}_2\text{Gd})_2(\mu\text{-Bbim})]$, **1-Gd** (blue) and $[\text{K}(\text{crypt-222})][(\text{Cp}^*\text{}_2\text{Gd})_2(\mu\text{-Bbim}^*)]$, **2-Gd**, (red).

Figure S9. FTIR spectra of $[(\text{Cp}^*\text{}_2\text{Tb})_2(\mu\text{-Bbim})]$, **1-Tb** (blue) and $[\text{K}(\text{crypt-222})][(\text{Cp}^*\text{}_2\text{Tb})_2(\mu\text{-Bbim}^*)]$, **2-Tb**, (red).

Figure S10. FTIR spectra of $[(\text{Cp}^*\text{}_2\text{Dy})_2(\mu\text{-Bbim})]$, **1-Dy** (blue) and $[\text{K}(\text{crypt-222})][(\text{Cp}^*\text{}_2\text{Dy})_2(\mu\text{-Bbim}^*)]$, **2-Dy**, (red).

Figure S11. Stacked FTIR spectra of $[(\text{Cp}^*\text{}_2\text{Ln})_2(\mu\text{-Bbim})]$, **1-Ln** (Ln = Y (gray), ¹Gd (turquoise), Tb (pink), Dy (blue)).

Figure S12. Stacked FTIR spectra $[K(\text{crypt-222})][(\text{Cp}^*_2\text{Ln})_2(\mu\text{-Bbim}^*)]$, **2-Ln** (Ln = Y (gray), ¹Gd (turquoise), Tb (pink), Dy (blue)).

UV/Vis Spectroscopy

Figure S13. Left: UV/Vis spectra of $[(\text{Cp}^*_2\text{Gd})_2(\mu\text{-Bbim})]$ (**1-Gd**, in blue) and $[\text{K}(\text{crypt-222})][(\text{Cp}^*_2\text{Gd})_2(\mu\text{-Bbim}^*)]$ (**2-Gd**, in red), taken in THF. Right: UV/Vis spectra of $[(\text{Cp}^*_2\text{Tb})_2(\mu\text{-Bbim})]$ (**1-Tb**, in blue) and $[\text{K}(\text{crypt-222})][(\text{Cp}^*_2\text{Tb})_2(\mu\text{-Bbim}^*)]$ (**2-Tb**, in red), taken in THF. Concentrations: **1-Gd**: 2.636×10^{-5} mol/L, **1-Tb**: 1.389×10^{-5} mol/L, **2-Gd**: 3.198×10^{-5} mol/L, **2-Tb**: 2.307×10^{-5} mol/L.

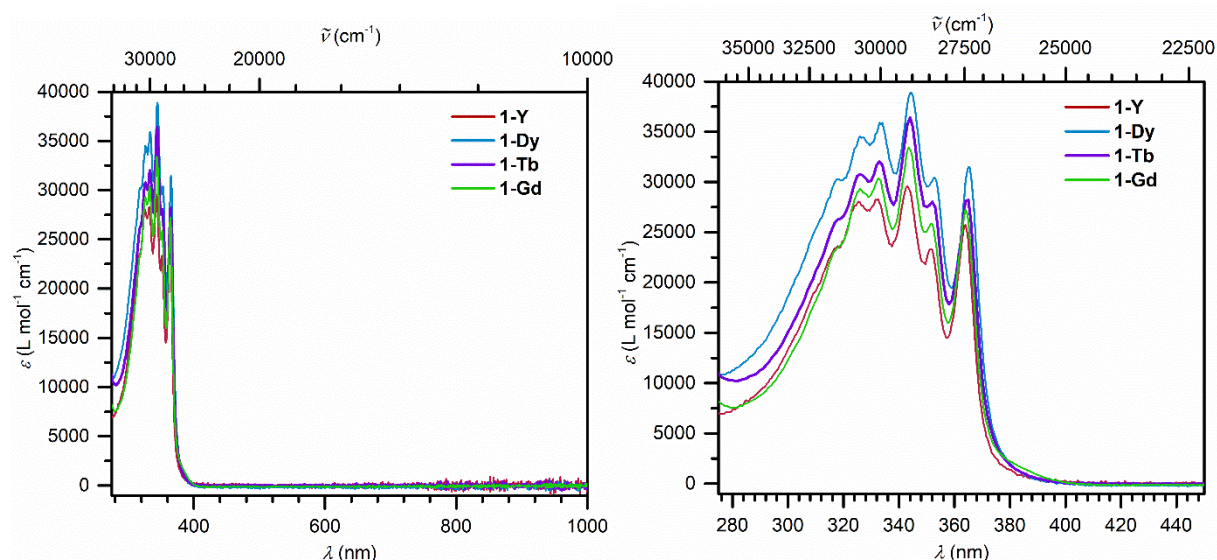

Figure S14. Left: Superimposed UV/Vis spectra of $[(\text{Cp}^*_2\text{Ln})_2(\mu\text{-Bbim})]$ (**1-Ln**, Y (red),¹ Gd (green), Tb (purple), Dy (blue)). Right: Magnification of superimposed UV/Vis spectra of $[(\text{Cp}^*_2\text{Ln})_2(\mu\text{-Bbim})]$ (**1-Ln**, Y (red), Gd (green), Tb (purple), Dy (blue)). Concentrations: **1-Y**: 8.054×10^{-6} mol/L, **1-Gd**: 2.636×10^{-5} mol/L, **1-Tb**: 1.389×10^{-5} mol/L, **1-Dy**: 1.353×10^{-5} mol/L.

Figure S15. Superimposed UV/Vis spectra of $[K(\text{crypt-222})][(\text{Cp}^*_2\text{Ln})_2(\mu\text{-Bbim}^*)]$ (**2-Ln**, Y (red),¹ Gd (green), Tb (purple), Dy (blue)). Concentrations: **2-Y**: 5.091×10^{-5} mol/L, **2-Gd**: 3.198×10^{-5} mol/L, **2-Tb**: 2.307×10^{-5} mol/L, **2-Dy**: 1.114×10^{-4} mol/L.

Cyclic Voltammetry

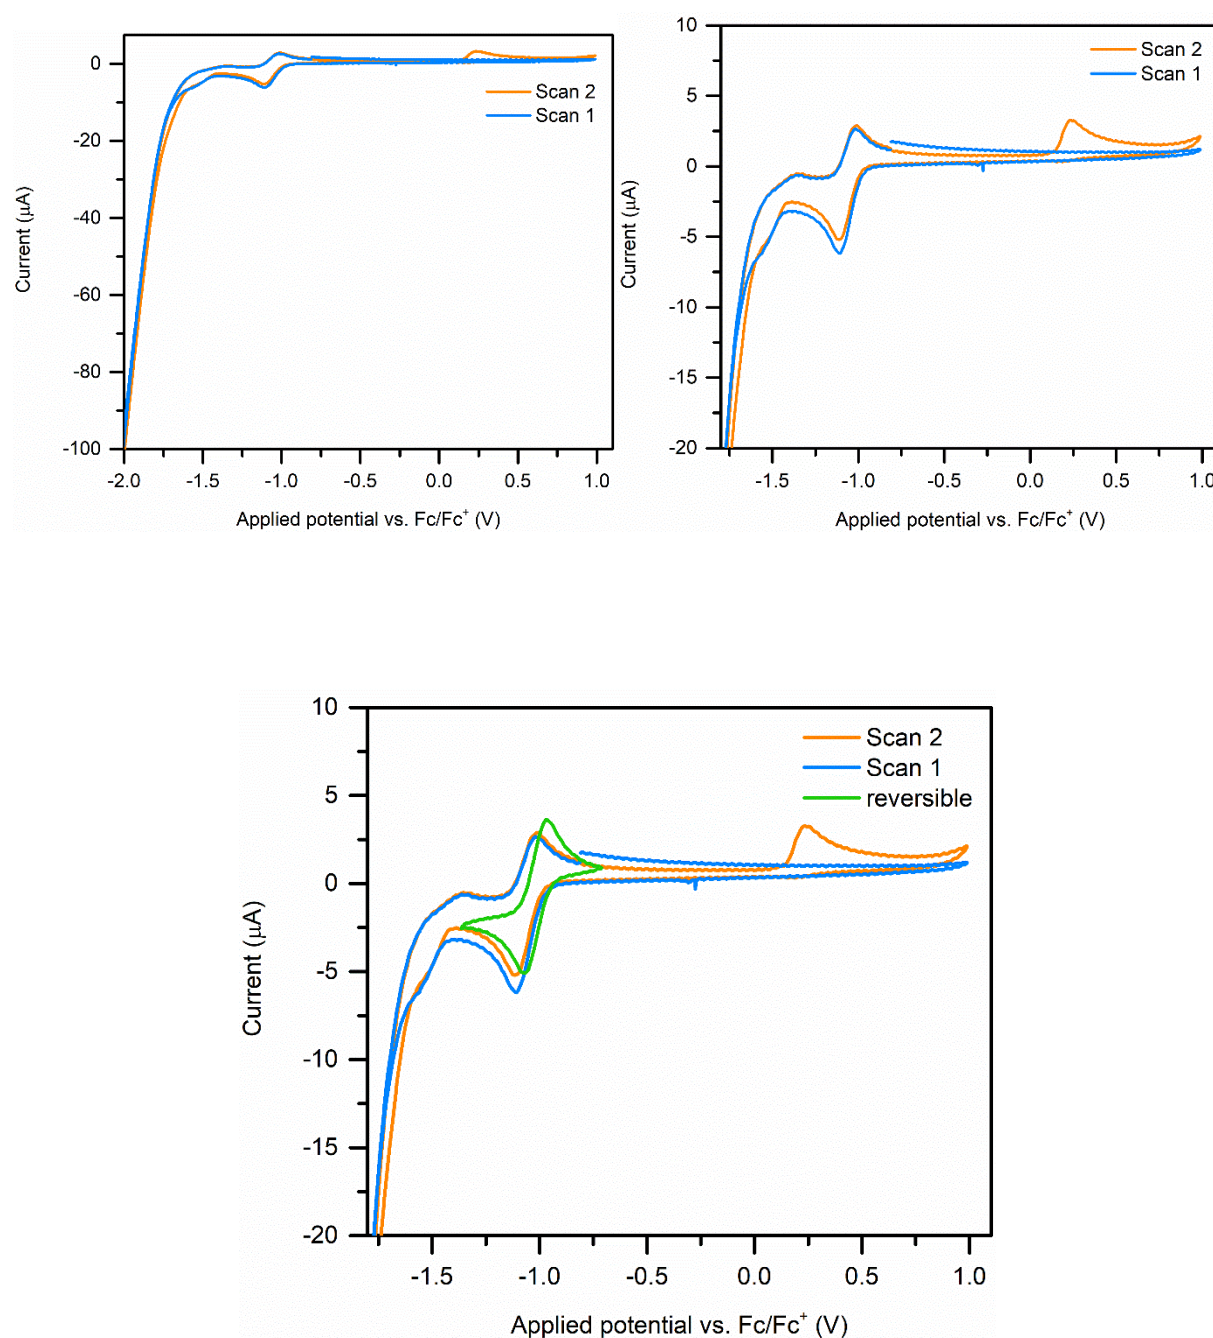

Figure S16. Top left: Full cyclic voltammogram of $[\text{K}(\text{crypt-222})][(\text{Cp}^*_2\text{Dy})_2(\mu\text{-Bbim}^*)]$, **2-Dy**, measured in THF at 300 K with 0.25 M $(^n\text{Bu}_4\text{N})\text{PF}_6$ supporting electrolyte and 1.7 mmol/L analyte concentration. The initial scan is depicted in blue, the second scan is depicted in orange. Top right: Magnification of the area between -1.8 and 1.1 V for the first and second scan. Bottom: Magnified scans superimposed with the reversible scan depicted in the main text.

Magnetism

Figure S17. Variable-temperature dc magnetic susceptibility data for restrained polycrystalline samples of **2-Dy** (dark red circles), **2-Tb** (pink triangles) and **2-Gd** (dark blue circles) collected under a 1 T applied dc field. The black line represents a fit to the data for **2-Gd** giving rise to $J = -1.85(4) \text{ cm}^{-1}$ and $g = 2.03(1)$.

Figure S18. Variable-temperature dc magnetic susceptibility data for a restrained polycrystalline sample of **2-Gd** collected under a 0.1 T applied dc field (top and bottom). The black line represents a fit to the data giving rise to $J = 1.96(2) \text{ cm}^{-1}$ and $g = 2.03(1)$.

Figure S19. Variable-temperature dc magnetic susceptibility data for a restrained polycrystalline sample of **2-Gd** collected under a 0.5 T applied dc field (top and bottom). The black line represents a fit to the data for **2-Gd** giving rise to $J = -1.88(2) \text{ cm}^{-1}$ and $g = 2.037(1)$.

Figure S20. Variable-temperature dc magnetic susceptibility data for a restrained polycrystalline sample of **2-Gd** collected under a 1 T applied dc field (top and bottom). The black line represents a fit to the data for **2-Gd** giving rise to $J = -1.85(1) \text{ cm}^{-1}$ and $g = 2.03(1)$.

Figure S21. Superimposed variable-temperature dc susceptibility data of polycrystalline **2-Gd** collected under 0.1 T (green triangles), 0.5 T (purple squares), 1 T (blue circles) applied dc field.

Figure S22. Variable-temperature dc magnetic susceptibility data for a restrained polycrystalline sample of **2-Dy** collected under a 0.1 T applied dc field.

Figure S23. Variable-temperature dc magnetic susceptibility data for a restrained polycrystalline sample of **2-Dy** collected under a 0.5 T applied dc field.

Figure S24. Variable-temperature dc magnetic susceptibility data for a restrained polycrystalline sample of **2-Dy** collected under a 1 T applied dc field.

Figure S25. Variable-temperature dc magnetic susceptibility data for a restrained polycrystalline sample of **1-Gd** collected under a 0.1 T applied dc field. The black line represents a fit to the data for **1-Gd** giving rise to $J = -0.064(2) \text{ cm}^{-1}$ and $g = 2.029(1)$.

Figure S26. Variable-temperature dc magnetic susceptibility data for a restrained polycrystalline sample of **1-Gd** collected under a 0.5 T applied dc field. The black line represents a fit to the data for **1-Gd** giving rise to $J = -0.056(1) \text{ cm}^{-1}$ and $g = 2.032(1)$.

Figure S27. Variable-temperature dc magnetic susceptibility data for a restrained polycrystalline sample of **1-Gd** collected under a 1 T applied dc field. The black line represents a fit to the data for **1-Gd** giving rise to $J = -0.058(1) \text{ cm}^{-1}$ and $g = 2.031(1)$.

Figure S28. Variable-temperature dc magnetic susceptibility data for a restrained polycrystalline sample of **1-Gd** collected under 0.1, 0.5, and 1 T applied dc fields.

Figure S29. Enlarged plot of variable-temperature dc magnetic susceptibility data for a restrained polycrystalline sample of **1-Gd** collected under 0.1, 0.5, and 1 T applied dc fields.

Figure S30. Variable-temperature dc magnetic susceptibility data for restrained polycrystalline samples of **1-Gd** and **2-Gd** collected under a 0.1 T applied dc field.

Figure S31. Variable-temperature dc magnetic susceptibility data for restrained polycrystalline samples of **1-Dy**, **1-Tb**, **1-Gd**, **2-Dy**, **2-Tb**, and **2-Gd** collected under a 0.1 T applied dc field.

Figure S32. Variable-temperature dc magnetic susceptibility data for a restrained polycrystalline sample of **1-Tb** collected under a 0.1 T applied dc field.

Figure S33. Variable-temperature dc magnetic susceptibility data for a restrained polycrystalline sample of **1-Tb** collected under a 0.5 T applied dc field.

Figure S34. Variable-temperature dc magnetic susceptibility data for a restrained polycrystalline sample of **1-Tb** collected under a 1 T applied dc field.

Figure S35. Variable-temperature dc magnetic susceptibility data for a restrained polycrystalline sample of **1-Tb** collected under 0.1, 0.5, and 1 T applied dc fields.

Figure S36. Variable-temperature dc magnetic susceptibility data for restrained polycrystalline samples of **1-Tb** and **2-Tb** collected under a 0.1 T applied dc field.

Figure S37. Variable-temperature dc magnetic susceptibility data for a restrained polycrystalline sample of **1-Dy** collected under a 0.1 T applied dc field.

Figure S38. Variable-temperature dc magnetic susceptibility data for a restrained polycrystalline sample of **1-Dy** collected under a 0.5 T applied dc field.

Figure S39. Variable-temperature dc magnetic susceptibility data for a restrained polycrystalline sample of **1-Dy** collected under 0.1 and 0.5 T applied dc fields.

Figure S40. Variable-temperature dc magnetic susceptibility data for restrained polycrystalline samples of **1-Dy** and **2-Dy** collected under a 0.5 T applied dc field.

Data derived from Ac Susceptibility Measurements

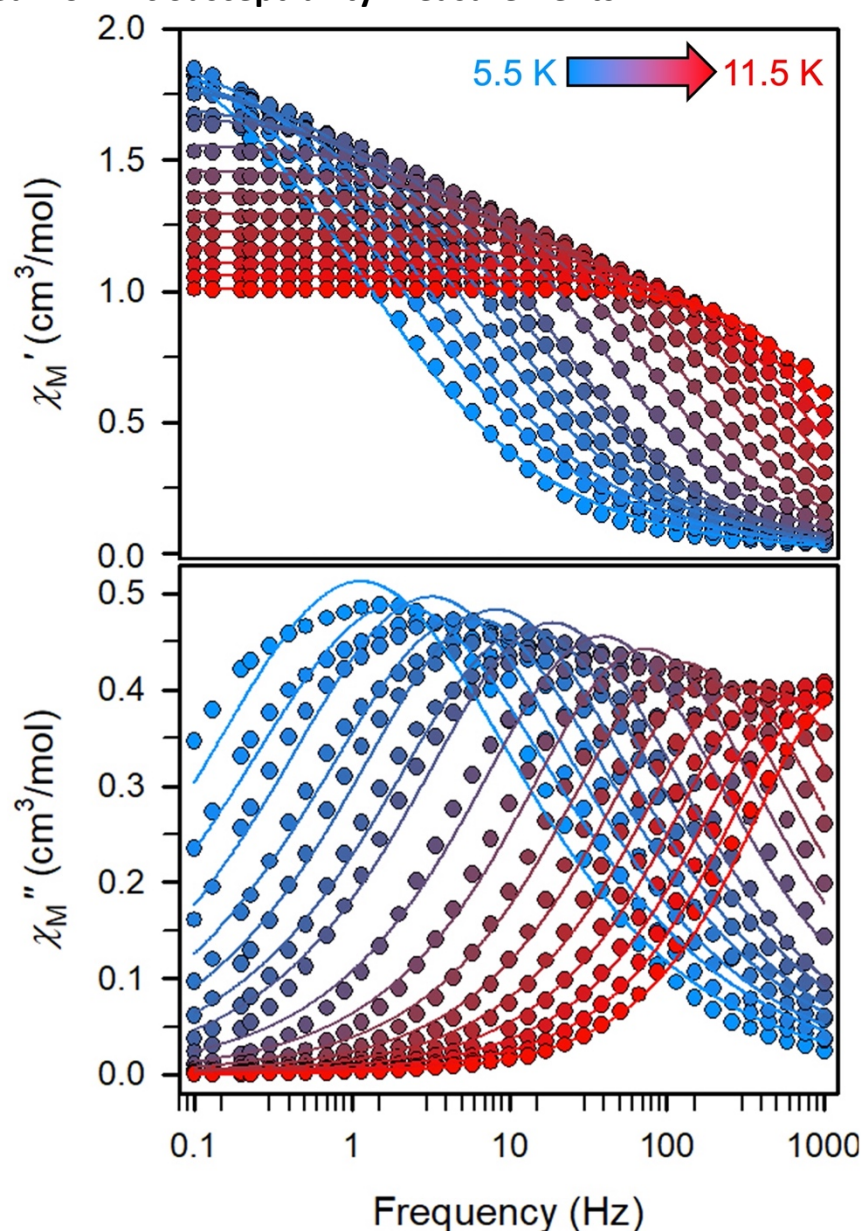

Figure S41. Variable-temperature, variable-frequency in-phase (χ_M') (top) and out-of-phase (χ_M'') (bottom) ac magnetic susceptibility data collected for **2-Dy** under a zero applied dc field from 5.5 to 11.5 K. Solid lines represent fits to the data, as described in the main text. A non-zero χ_M'' out-of-phase signal indicates the presence of an energy barrier to spin reversal.

Figure S42. Cole-Cole (Argand) plots for ac susceptibility collected from 4.5 to 11.5 K under zero applied dc field for **2-Dy**. Symbols represent the experimental data points and the points representing the fits are connected by black solid lines.

Figure S43. Arrhenius plots of relaxation time data for **2-Dy** obtained between 4.5 and 11.5 K (see Figure 6 in the main text). The black line corresponds to a linear fit to the Arrhenius equation, as described in the main text, yielding $U_{\text{eff}} = 48.9(1) \text{ cm}^{-1}$ and $\tau_0 = 3.2(1) \times 10^{-7} \text{ s}$ (all data points between 4.5 and 5.5 K were fitted).

Figure S44. Cole-Cole (Argand) plots for ac susceptibility collected from 5.5 to 11.5 K under zero applied dc field for **2-Dy**. Symbols represent the experimental data points and the points representing the fits are connected by black solid lines.

Figure S45. Arrhenius plot of relaxation time data for **2-Dy** obtained between 5.5 and 11.5 K (see Figure S24). The black line corresponds to a linear fit to the Arrhenius equation, as described in the main text, yielding $U_{\text{eff}} = 51.9(1) \text{ cm}^{-1}$ and $\tau_0 = 1.91(1) \times 10^{-7} \text{ s}$. Data points between 5.5 K and 11.5 K were fitted due to the slight curvature in Figure S23 indicating a deviation from linearity of the temperature-dependent τ at the lowest measured temperatures. The obtained values for U_{eff} and τ_0 are similar to those shown in Figure S23

Figure S46. Variable-temperature, variable-frequency in-phase (χ_M') ac magnetic susceptibility data collected for **1-Dy** under a zero applied dc field from 5.5 to 24.5 K. Solid lines represent fits to the data, as described in the main text. A non-zero χ_M'' out-of-phase signal indicates the presence of an energy barrier to spin reversal.

Figure S47. Cole-Cole (Argand) plots for ac susceptibility collected from 5.5 to 24.5 K under zero applied dc field for **1-Dy**. Symbols represent the experimental data points and the points representing the fits are connected by black solid lines.

Figure S48. Arrhenius plots of relaxation time data for **1-Dy** obtained between 5.5 and 11.5 K (see Figure 7 in the main text) through ac magnetic susceptibility measurements. The black line corresponds to a fit to Orbach and Raman relaxation processes, as described in the main text, yielding $U_{\text{eff}} = 185.0(1) \text{ cm}^{-1}$ and $\tau_0 = 1.0(1) \times 10^{-8} \text{ s}$.

Figure S49. Individual contributions of the multiple magnetic relaxation pathways to the Arrhenius plot of **1-Dy** at 0 Oe shown in Figure S48. The best fit yielded $U_{\text{eff}} = 185.0(1) \text{ cm}^{-1}$ and $\tau_0 = 1.0(1) \times 10^{-8} \text{ s}$. The red line represents a fit to one Orbach relaxation process and a Raman process. Individual parameters used to calculate the contributions are given in Table S6.

Data derived from Dc Relaxation Experiments

Figure S50. Plot of magnetization vs. time used to derive relaxation times for **2-Dy** at 1.8 K. The data (pale blue circles) were fit to a function of the form $y = a \cdot \exp(-((t/\tau)^b))$ where b is a stretch factor (black line). Decay of the magnetization vs. time for **2-Dy**, obtained by applying a magnetic field of 0.1 T to the sample at a temperature of 50 K, cooling the sample to 1.8 K, and then removing the magnetic field.

Figure S51. Plot of magnetization vs. time used to derive relaxation times for **2-Dy** at 2.0 K. The data (pale blue circles) were fit to a function of the form $y = a \cdot \exp(-((t/\tau)^b))$ where b is a stretch factor (black line). Decay of the magnetization vs. time for **2-Dy**, obtained by applying a magnetic field of 0.1 T to the sample at a temperature of 50 K, cooling the sample to 2.0 K, and then removing the magnetic field.

Figure S52. Plot of magnetization vs. time used to derive relaxation times for **2-Dy** at 2.5 K. The data (pale blue circles) were fit to a function of the form $y = a \cdot \exp(-((t/\tau)^b))$ where b is a stretch factor (black line). Decay of the magnetization vs. time for **2-Dy**, obtained by applying a magnetic field of 0.1 T to the sample at a temperature of 50 K, cooling the sample to 2.5 K, and then removing the magnetic field.

Figure S53. Plot of magnetization vs. time used to derive relaxation times for **2-Dy** at 3.0 K. The data (pale blue circles) were fit to a function of the form $y = a \cdot \exp(-((t/\tau)^b))$ where b is a stretch factor (black line). Decay of the magnetization vs. time for **2-Dy**, obtained by applying a magnetic field of 0.1 T to the sample at a temperature of 50 K, cooling the sample to 3.0 K, and then removing the magnetic field.

Figure S54. Plot of magnetization vs. time used to derive relaxation times for **2-Dy** at 3.5 K. The data (pale blue circles) were fit to a function of the form $y = a \cdot \exp(-(t/\tau)^b)$ where b is a stretch factor (black line). Decay of the magnetization vs. time for **2-Dy**, obtained by applying a magnetic field of 0.1 T to the sample at a temperature of 50 K, cooling the sample to 3.5 K, and then removing the magnetic field.

Figure S55. Plot of magnetization vs. time used to derive relaxation times for **2-Dy** at 4.0 K. The data (pale blue circles) were fit to a function of the form $y = a \cdot \exp(-(t/\tau)^b)$ where b is a stretch factor (black line). Decay of the magnetization vs. time for **2-Dy**, obtained by applying a magnetic field of 0.1 T to the sample at a temperature of 50 K, cooling the sample to 4.0 K, and then removing the magnetic field.

Figure S56. Plot of magnetization (normalized) vs. time used to derive relaxation times for **2-Dy** at different temperatures. The data were fit to a function of the form $y = a \cdot \exp(-(t/\tau)^b)$ where b is a stretch factor (black line). Decay of the magnetization vs. time for **2-Dy**, obtained by applying a magnetic field of 0.1 T to the sample at a temperature of 50 K, cooling the sample to a given temperature, and then removing the magnetic field.

Table S3. Relaxation times, τ (s), and stretch factors, b , at various temperatures, T (K) for **2-Dy**.

T (K)	τ (s)	stretch factor
1.8	68.87740572	0.828653282
2.0	65.61476463	0.825878046
2.5	34.00662524	1.388001075
3.0	28.31669823	1.107648596
3.5	20.95021698	1.213686665
4.0	12.89217026	1.148894262

Figure S57. Individual contributions of the multiple magnetic relaxation pathways to the Arrhenius plot of **2-Dy** at 0 Oe shown in Figure 7 of the main text. The best fit yielded $U_{\text{eff}} = 49.2(1) \text{ cm}^{-1}$ and $\tau_0 = 3.1(1) \times 10^{-7} \text{ s}$. The red line represents a fit to one Orbach relaxation process and a tunneling pathway. Individual parameters used to calculate the contributions are given in Table S4.

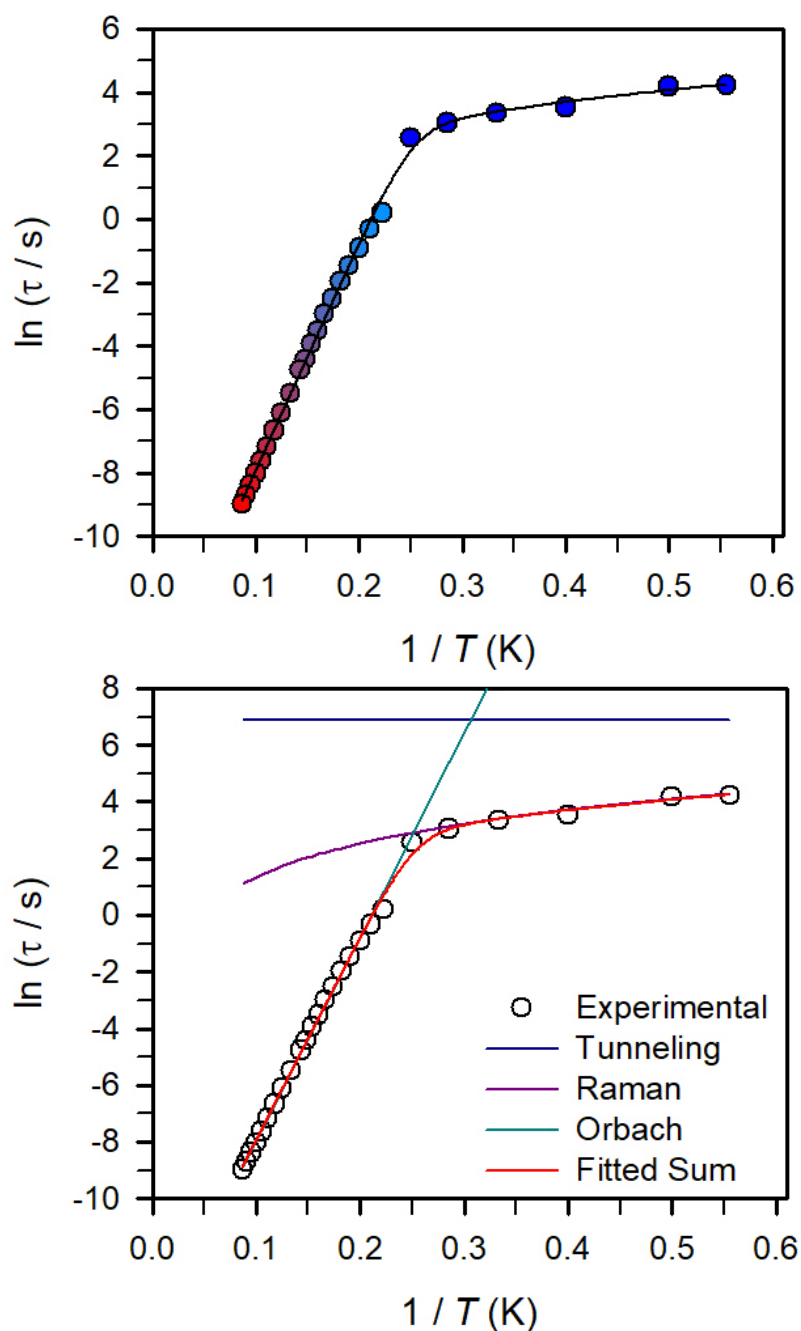

Figure S58. Arrhenius plots of relaxation time data derived from ac magnetic susceptibility measurements at temperatures from 4.5 to 11.5 K (pale blue to red circles) and dc relaxation experiments within the temperature range of 1.8 to 4 K (dark blue circles) for **2-Dy**. The black solid line (top) corresponds to a fit to one Orbach, one Raman, and one QTM process giving rise to $U_{\text{eff}} = 49.9(1) \text{ cm}^{-1}$ and $\tau_0 = 2.7(1) \times 10^{-7} \text{ s}$, where the corresponding individual contributions of the multiple magnetic relaxation pathways are shown on the bottom. Individual parameters used to calculate the contributions are given in Table S4. The inclusion of a Raman process did not improve the quality of the fit.

Table S4. Best-fit parameters for the Arrhenius plot of **2-Dy** at $H_{dc} = 0$ Oe. Data from 4.5 to 11.5 K and from 5.5 K to 11.5 K were extracted from ac susceptibility measurements. Data from 1.8 to 11.5 K was extracted from ac and dc susceptibility measurements.

	τ_{QTM} (s)	C ($s^{-1}K^{-n}$)	n	τ_0 (s)	U_{eff} (cm^{-1})
4.5 to 11.5 K	-	-	-	$3.2(1) \times 10^{-7}$	48.9(1)
5.5 to 11.5 K	-	-	-	$1.91(1) \times 10^{-7}$	51.9(1)
1.8 to 11.5 K	41.7(1)	-	-	$3.1(1) \times 10^{-7}$	49.2(1)
1.8 to 11.5 K	993.8(2)	$4.9(1) \times 10^{-3}$	1.73(2)	$2.7(1) \times 10^{-7}$	49.9(1)

Figure S59. Plot of magnetization vs. time used to derive relaxation times for **1-Dy** at 1.8 K. The data (pale pink circles) were fit to a function of the form $y = a \cdot \exp(-(t/\tau)^b)$ where b is a stretch factor (black line). Decay of the magnetization vs. time for **1-Dy**, obtained by applying a magnetic field of 1 T to the sample at a temperature of 50 K, cooling the sample to 1.8 K, and then removing the magnetic field.

Figure S60. Plot of magnetization vs. time used to derive relaxation times for **1-Dy** at 2 K. The data (pale pink circles) were fit to a function of the form $y = a \cdot \exp(-(t/\tau)^b)$ where b is a stretch factor (black line). Decay of the magnetization vs. time for **1-Dy**, obtained by applying a magnetic field of 1 T to the sample at a temperature of 50 K, cooling the sample to 2 K, and then removing the magnetic field.

Figure S61. Plot of magnetization vs. time used to derive relaxation times for **1-Dy** at 2.2 K. The data (pale pink circles) were fit to a function of the form $y = a \cdot \exp(-(t/\tau)^b)$ where b is a stretch factor (black line). Decay of the magnetization vs. time for **1-Dy**, obtained by applying a magnetic field of 1 T to the sample at a temperature of 50 K, cooling the sample to 2.2 K, and then removing the magnetic field.

Figure S62. Plot of magnetization vs. time used to derive relaxation times for **1-Dy** at 2.5 K. The data (pale pink circles) were fit to a function of the form $y = a \cdot \exp(-(t/\tau)^b)$ where b is a stretch factor (black line). Decay of the magnetization vs. time for **1-Dy**, obtained by applying a magnetic field of 1 T to the sample at a temperature of 50 K, cooling the sample to 2.5 K, and then removing the magnetic field.

Figure S63. Plot of magnetization vs. time used to derive relaxation times for **1-Dy** at 2.75 K. The data (pale pink circles) were fit to a function of the form $y = a \cdot \exp(-(t/\tau)^b)$ where b is a stretch factor (black line). Decay of the magnetization vs. time for **1-Dy**, obtained by applying a magnetic field of 1 T to the sample at a temperature of 50 K, cooling the sample to 2.75 K, and then removing the magnetic field.

Figure S64. Plot of magnetization vs. time used to derive relaxation times for **1-Dy** at 3 K. The data (pale pink circles) were fit to a function of the form $y = a \cdot \exp(-((t/\tau)^b))$ where b is a stretch factor (black line). Decay of the magnetization vs. time for **1-Dy**, obtained by applying a magnetic field of 1 T to the sample at a temperature of 50 K, cooling the sample to 3 K, and then removing the magnetic field.

Figure S65. Plot of magnetization vs. time used to derive relaxation times for **1-Dy** at 3.25 K. The data (pale pink circles) were fit to a function of the form $y = a \cdot \exp(-((t/\tau)^b))$ where b is a stretch factor (black line). Decay of the magnetization vs. time for **1-Dy**, obtained by applying a magnetic field of 1 T to the sample at a temperature of 50 K, cooling the sample to 3.25 K, and then removing the magnetic field.

Figure S66. Plot of magnetization vs. time used to derive relaxation times for **1-Dy** at 3.5 K. The data (pale pink circles) were fit to a function of the form $y = a \cdot \exp(-(t/\tau)^b)$ where b is a stretch factor (black line). Decay of the magnetization vs. time for **1-Dy**, obtained by applying a magnetic field of 1 T to the sample at a temperature of 50 K, cooling the sample to 3.5 K, and then removing the magnetic field.

Figure S67. Plot of magnetization vs. time used to derive relaxation times for **1-Dy** at 4 K. The data (pale pink circles) were fit to a function of the form $y = a \cdot \exp(-(t/\tau)^b)$ where b is a stretch factor (black line). Decay of the magnetization vs. time for **1-Dy**, obtained by applying a magnetic field of 1 T to the sample at a temperature of 50 K, cooling the sample to 4 K, and then removing the magnetic field.

Figure S68. Plot of magnetization vs. time used to derive relaxation times for **1-Dy** at 4.5 K. The data (pale pink circles) were fit to a function of the form $y = a \cdot \exp(-((t/\tau)^b))$ where b is a stretch factor (black line). Decay of the magnetization vs. time for **1-Dy**, obtained by applying a magnetic field of 1 T to the sample at a temperature of 50 K, cooling the sample to 4.5 K, and then removing the magnetic field.

Figure S69. Plot of magnetization (normalized) vs. time used to derive relaxation times for **1-Dy** at different temperatures. The data were fit to a function of the form $y = a \cdot \exp(-((t/\tau)^b))$ where b is a stretch factor (black line). Decay of the magnetization vs. time for **1-Dy**, obtained by applying a magnetic field of 1 T to the sample at a temperature of 50 K, cooling the sample to a given temperature, and then removing the magnetic field.

Table S5. Relaxation times, τ (s), and stretch factors, b , at various temperatures, T (K) for **1-Dy**.

T (K)	τ (s)	stretch factor
1.8	146.1907	0.84552
2.0	130.2492	0.84555
2.2	111.7248	0.841136
2.5	86.93023	0.858337
2.75	65.26766	0.879887
3.0	49.3119	0.939921
3.25	34.76398	0.960858
3.5	24.93626	1.024986
4.0	12.09809	1.10035
4.5	5.240397	1.246521

Figure S70. Individual contributions of the multiple magnetic relaxation pathways to the Arrhenius plot of **1-Dy** at 0 Oe shown in Figure 7 of the main text. The best fit yielded $U_{\text{eff}} = 182.1(1) \text{ cm}^{-1}$ and $\tau_0 = 3.0(1) \times 10^{-8} \text{ s}$. The red line represents a fit to one Orbach relaxation process, a Raman process and a tunneling pathway. Individual parameters used to calculate the contributions are given in Table S6.

Table S6. Best-fit parameters for the Arrhenius plot of **1-Dy** at $H_{\text{dc}} = 0 \text{ Oe}$. Data from 5.5 to 24.5 K was extracted from ac susceptibility measurements. Data from 1.8 to 24.5 K was extracted from ac and dc susceptibility measurements.

	$\tau_{\text{QTM}} (\text{s})$	$C (\text{s}^{-1}\text{K}^{-n})$	n	$\tau_0 (\text{s})$	$U_{\text{eff}} (\text{cm}^{-1})$
5.5 to 24.5 K	-	$1.6(1) \times 10^{-4}$	4.92(2)	$1.0 (1) \times 10^{-8}$	185.0(1)
1.8 to 24.5 K	208.0(1)	$5.5(2) \times 10^{-5}$	5.36(3)	$3.0(1) \times 10^{-8}$	182.1(1)

Figure S71. Comparison of all relaxation times data derived from ac magnetic susceptibility measurements and dc relaxation experiments for **1-Dy** and **2-Dy**, respectively.

CASSCF Calculations

Table S7. Computed energy levels (the ground state is set at zero) and main components (>10%) of the wavefunction for each m_j state of the ground-state multiplet 7F_6 for first individual Tb center of **2-Tb** at the CAS(8,7)SCF – RASSI-SO level.
