1 General

All chemicals were purchased from Sigma Aldrich, Acros Organics, Alfa Aesar or ABCR and were used as received. All solvents were purchased from Roth. Solvents labeled with abs. were absolutely dry. Laboratory grade water was used from the in-house equipment (desalination apparatus). Gene strings were ordered from Invitrogen by Thermo Fisher Scientific and Plasmids containing genes were ordered from Biocat GmbH and General Biosystems. PsDRR was a gift from Prof. P. Facchini. Glucose dehydrogenase (GDH) was obtained as a crude cell-free extract from DSM (activity for NADP⁺ of batches GDH.002, GDH.003 and GDH.004: 2.2-2.4 U mg⁻¹) and used as received. Lb-ADH was available in-house and published earlier from our group.[1] FDH was available as in-house preparation based on a published sequence (NADP-FDH-Variant D222Q/H224N from Pseudomonas sp. 101, see expression part).[2-3] PtDH was prepared based on a published sequence (see expression part).[4-5]

All equipment was used under standard conditions unless stated otherwise.

TLC

Reactions were monitored via TLC. As stationary phase silica gel plates from Merck were used (silica gel 60 F254, 20x20 cm). Detection was achieved by UV (254 nm) and CAM blue. For making the detection faster a heat gun was used to dry the silica gel plates.

TLC solutions:

CAM blue: 90 mL H₂O (distilled), 2.5 g ammonium molybdate tetrahydrate, 1 g ammonium cerium(IV) sulfate dehydrate, stirring until dissolved and 10 mL H₂SO₄ added.

Flash chromatography

Column chromatography was performed on silica gel 60 from Merck with particle sizes 40-63 μm. A 30- to 100-fold excess of silica gel was used with respect to the mass of dry crude product, depending on the separation problem. The crude material was dissolved in an appropriate solvent and either loaded as the liquid material or subsequently adsorbed on the 2.5-fold excess of Celite™. For the Celite preparation, the solvent was removed under vacuum and the adsorbed crude material was dried under oil pump vacuum. The dimension of the column was adjusted to the required amount of silica gel and formed a pad between 16 and 30 cm. In general, the silica gel was mixed with the eluent and charged into the column before equilibration by forcing an appropriate amount of eluent through by over-pressure. Subsequently, the dissolved or adsorbed crude material was loaded onto the top of the silica gel and the mobile phase was forced through the column by pressure exerted by a rubber bulb pump. The volume of each collected fraction was adjusted between 20% and 30% of the silica gel volume, according to the separation problem.
**Instrumentation**

$^1$H- and $^{13}$C- and spectra were recorded on a Bruker AVANCE III 300 spectrometer ($^1$H: 300.36 MHz; $^{13}$C: 75.53 MHz) with an autosampler. Chemical shifts were referenced to the residual proton and carbon signal of the deuterated solvent [CDCl$_3$: $\delta = 7.260$ ppm ($^1$H), 77.160 ppm ($^{13}$C); MeOH-d$_4$: $\delta = 3.31$ ($^1$H), 49.00 ppm ($^{13}$C)]. Chemical shifts $\delta$ are given in ppm (parts per million) and coupling constants $J$ in Hz (Hertz). Signal multiplicities are abbreviated as $s$ (singlet), $bs$ (broad singlet), $d$ (doublet), $dd$ (doublet of doublet), $t$ (triplet) and $m$ (multiplet). Additionally, quaternary carbon atoms are designated as C$_q$ and aromatic carbon atoms bearing a hydrogen as CH$_{arom}$. 1D-NMR spectra (APT) as well as 2D-NMR spectra (HH-COSY, HSQC) were recorded for the identification and confirmation of the structure. Deuterated solvents for nuclear resonance spectroscopy were purchased from Roth, Armar Chemicals and Euriso-top*.

GC-MS measurements were performed on an Agilent 7890A GC system, equipped with an Agilent 5975C mass-selective detector (EI 70 eV) and a HP-5-MS column (30 m x 0.25 mm x 0.25 µm film) using He at a flow rate of 0.5 mL min$^{-1}$. Temperature program: 100 °C, hold 0.5 min, 10 °C min$^{-1}$ 300 °C, hold 2 min, inlet temperature 250 °C.

Melting points were determined on an "MPD350.BM2.5" melting point apparatus from Gallenkamp with an integrated microscopical support. They were measured in open capillary tubes and were not corrected.

IR-spectra were recorded neat on a Bruker Alpha-P (ATR) instrument.

High resolution mass spectra were recorded on an Agilent 6230 TOF LC/MS using ESI method (positive or negative mode, nozzle voltage 2.0 kV) with coupled Agilent 1260 Infinity Series HPLC.

**Liquid chromatography**

Low resolution mass spectra (LC-MS) were recorded on an Agilent Technologies 6120 Quadrupole LC/MS detector in combination with an Agilent Technologies 1260 Infinity HPLC system, equipped with a Kinetex 2.6 µm C-18 100 Â column (50x4.6 mm) or a Luna 5 µm C-18 100 Â column (250x4.6 mm). Water/acetonitrile (+0.1 vol-% of formic acid) was used as eluent.

HPLC-UV analysis was carried out on a Shimadzu HPLC system, equipped with a Luna 5 µm C-18 100 Â column (250x4.6 mm) [DGU-20A (degasser), LC-20A (pump), SIL-20A (autosampler), CTO-20AC (column oven), SPD-M20A (detector), CBM-20AC (controller)] with water, acetonitrile and methanol as eluent. As additive either TFA or DEA [0.1% (v/v)] or none of them were used.

Determination of reticuline and salutaridine: HPLC yields were determined by HPLC on an achiral reversed phase C18 stationary phase (Luna). Eluent: buffer (30 mM HCOONH$_4$, pH 2.8)/methanol/acetonitrile = 67/30/3 (isocratic); flow rate: 0.5 mL min$^{-1}$; column temperature: 25 °C; detection wavelength: 280 nm.
2 Chemical synthesis of iminium salt 2

Scheme S1: Synthetic route towards natural intermediate 2.

2-(4-Hydroxy-3-methoxyphenyl)acetaldehyde, homovanillin (28)

A three-necked round-bottom flask (500 mL) with a magnetic stirring bar was charged with eugenol (24, 5.00 g, 30.5 mmol, 1 eq) followed by CH₂Cl₂ (125 mL) and MeOH (125 mL). The yellow solution was cooled to -10 °C with a cryostat in an EtOH bath and an O₃/O₂ mixture was passed through the solution through a sintered glass frit for 6 h. After complete consumption of the starting material (TLC, EtOAc/cyclohexane = 3:1, Rf = 0.54), nitrogen was passed through the solution for 10 min in order to remove the excess of ozone. The reactive intermediate was quenched by the addition of Me₂S (11.2 mL, 153 mmol, 5 eq) at -10 °C and after 15 min the mixture was allowed to warm to room temperature. After complete removal of the hydroperoxyacetal (TLC, cyclohexane/EtOAc = 1:1, Rf = 0.36) the mixture was reduced under vacuum. The product was purified by column chromatography [size: 30 x 6 cm, cyclohexane/EtOAc =3:1 (v/v)].

Yield: 3.77 g (22.7 mmol, 74%) pale-yellow solid.

Rf = 0.44 (cyclohexane/ EtOAc = 1:1 (v/v)) (254 nm, CAM: dark blue).

IR (ATR) = 3341, 3062, 3005, 2988, 2955, 2867, 2748, 1702, 1599, 1510, 1463, 1451, 1429, 1363, 1261, 1233, 1205, 1175, 1148, 1123, 1048, 1025, 1008, 916, 852, 808, 792, 710, 621, 561, 506, 467 cm⁻¹.

mp: 43 - 45 °C.

¹H-NMR (300.13 MHz, CDCl₃): δ = 9.71 (t, J = 2.5 Hz, 1H, CHO), 6.91 (d, J = 8.0 Hz, 1H, CHarom), 6.72 (dd, J = 8.0, 2.0 Hz, 1H, CHarom), 6.68 (d, J = 2.0 Hz, 1H, CHarom), 5.64 (bs, 1H, OH), 3.88 (s, 3H, OCH₃), 3.60 (d, J = 2.5 Hz, 2H, CH₂).

¹³C-NMR (75.47 MHz, CDCl₃): δ = 199.7 (CHO), 147.0 (Ca), 145.2 (Ca), 123.5 (Ca), 122.7 (CHarom), 115.0 (CHarom), 112.1 (CHarom), 56.1 (OCH₃), 50.3 (CH₂).

GC-MS (ACHIRAL-MSD): tR = 8.086 min, m/z (rel. int.) = 166 [M⁺] (25), 138 (9), 137 (100), 122 (18), 94 (11), 77 (6), 66 (5), 51 (6).
HR-MS (HPLC-ESI): m/z [M-H]- calcd for C₉H₁₀O₃: 165.0557; found: 165.0557.

4-(2-(Benzyl(methyl)amino)ethyl)-2-methoxyphenol (30)

A dry 500 mL round-bottom flask with magnetic stirring bar was charged with 2-(4-hydroxy-3-methoxyphenyl)acetaldehyde (28) (4.00 g, 24.1 mmol, 1 eq) and CH₂Cl₂ (240 mL). The pale-yellow solution was cooled to 0 °C with an ice bath and N-methyl-1-phenylmethanamine (29) (4.80 mL, 36.1 mmol, 1.5 eq) was slowly added. NaBH(OAc)$_3$ (10.4 g, 48.1 mmol, 2 eq) was added in portions over a period of 3 min, the flask was sealed with a septum and the mixture was left stirring in the thawing ice bath. After 150 min another portion of NaBH(OAc)$_3$ (2.60 g, 0.5 eq) was added at room temperature. Complete conversion of the starting material was detected after a total of 18 h by TLC and the reaction mixture was quenched by the addition of saturated aqueous NaHCO₃ solution and solid NaHCO₃. The solvents were removed on the rotary evaporator (bath temperature: 50 °C) and the product was purified by two consecutive column chromatographies (1st column: 16 x 4.8 cm, CH₂Cl₂/acetone = 2:1; 2nd column: 16 x 4.8 cm, CH₂Cl₂/acetone = 2:1).

Yield: 5.15 g (19.0 mmol, 79%) light-brown solid.

Rf = 0.73 (CHCl₃/MeOH/NH₄OH = 4:1:1% (v/v/v)) (254 nm, CAM: dark blue).

IR (ATR) = 2995, 2968, 2931, 2857, 2827, 2757, 2671, 2544, 2478, 1603, 1588, 1513, 1497, 1464, 1455, 1430, 1417, 1382, 1343, 1311, 1268, 1231, 1195, 1152, 1125, 1081, 1033, 1004, 987, 961, 924, 860, 843, 824, 778, 755, 728, 700, 639, 562, 487, 463, 426, 412 cm⁻¹.

mp: 94 - 96 °C.

$^1$H-NMR (300.13 MHz, CDCl₃): $\delta$ = 7.37 – 7.21 (m, 5H, CH$_{arom}$), 6.82 (d, $J$ = 7.8 Hz, 1H, CH$_{arom}$), 6.72 – 6.63 (m, 2H, CH$_{arom}$), 3.86 (s, 3H, OCH₃), 3.62 (s, 2H, ArCH$_2$N), 2.86 – 2.75 (m, 2H, CH₂), 2.73 – 2.61 (m, 2H, CH₂), 2.32 (s, 3H, NCH₃).

$^{13}$C-NMR (75.47 MHz, CDCl₃): $\delta$ = 146.6 (Cq), 144.1 (Cq), 138.1 (Cq), 132.1 (Cq), 129.4 (CH$_{arom}$), 128.5 (CH$_{arom}$), 127.4 (CH$_{arom}$), 121.4 (CH$_{arom}$), 114.4 (CH$_{arom}$), 111.5 (CH$_{arom}$), 62.1 (CH₂), 59.3 (CH₂), 56.0 (OCH₃), 42.0 (NCH₃), 33.4 (CH₂).

HR-MS (HPLC-ESI): m/z [M+H]⁺ calcd for C$_{17}$H$_{21}$NO$_2$: 272.1645; found: 272.1645.

2-Methoxy-4-(2-(methylamino)ethyl)phenol hydrochloride (26·HCl)

A 1000 mL round-bottom flask with magnetic stirring bar was charged with 4-(2-(benzyl(methyl)amino)ethyl)-2-methoxyphenol (30) (4.35 g, 16.0 mmol, 1 eq), 2-propanol (160 mL), 12 M aqueous HCl (2.7 mL, 32.0 mmol, 2 eq) and Pd/C 10% (218 mg). A balloon with hydrogen was fitted on top of the flask and it was evacuated and backfilled with hydrogen. The mixture was vigorously stirred at 22 °C until complete conversion of the starting material was detected after 3 d. The mixture was filtrated through a pad of Celite (6 cm) and the pad was rinsed consecutively...
with 2-propanol (500 mL), 2-propanol/H2O (1:1, 300 mL) and MeOH (400 mL). The solvents were removed on the rotary evaporator and the product was dried under vacuum.

Yield: 3.13 g (14.4 mmol, 90%) brown solid.

Rf = 0.35 (CHCl3/MeOH/NH4OH = 2:1:1% (v/v/v)) (254 nm, CAM: blue).

IR (ATR) = 3113, 3066, 3021, 2962, 2935, 2846, 2758, 2423, 1602, 1586, 1523, 1455, 1432, 1404, 1373, 1310, 1277, 1263, 1235, 1218, 1205, 1156, 1132, 1112, 1046, 1032, 996, 958, 910, 861, 824, 794, 728, 677, 628, 567, 548, 517, 454 cm⁻¹.

mp: 145 - 147 °C.

1H-NMR (300.13 MHz, MeOD-d4): δ = 6.92 (d, J = 1.9 Hz, 1H, CHarom), 6.82 (d, J = 8.0 Hz, 1H, CHarom), 6.77 (dd, J₁ = 8.0 Hz, J₂ = 1.9 Hz, 1H, CHarom), 3.86 (s, 3H, OCH3), 3.22 (t, J = 7.7 Hz, 2H, CH2), 2.92 (t, J = 7.4 Hz, 2H, CH2), 2.70 (s, 3H, NCH3).

13C-NMR (75.47 MHz, MeOD-d4): δ = 149.3 (Cq), 146.8 (Cq), 128.8 (Cq), 122.3 (CHarom), 116.6 (CHarom), 113.4 (CHarom), 56.5 (OCH3), 51.8 (CH3), 33.8 (NCH3), 32.9 (CH2).

Note: The deprotected amine salt can be directly used for the following amide coupling step without the need of a column chromatography purification.

**N-(4-Hydroxy-3-methoxyphenethyl)-2-(3-hydroxy-4-methoxyphenyl)-N-methylacetamide (25)**

A dry 250 mL round-bottom flask with magnetic stirring bar was charged with 2-methoxy-4-(2-(methylamino)ethyl)phenol hydrochloride (26·HCl) (560 mg, 2.57 mmol, 1.05 eq), DMF (20 mL) and Oxyma Pure (350 mg, 2.44 mmol, 1 eq). The yellow solution was cooled to 0 °C with an ice bath and Et3N (0.34 mL, 2.44 mmol, 1 eq) was added followed by EDC·HCl (520 mg, 2.69 mmol, 1.1 eq). To the vigorously stirred solution 2-(3-hydroxy-4-methoxyphenyl)acetic acid (27) (460 mg, 2.44 mmol, 1 eq) in DMF (4 mL) was added dropwise over a period of 3 h via syringe pump. Complete conversion of the starting material was detected after 19 h (TLC) and the solvent was removed under vacuum. The residual solid material was dissolved in EtOAc (70 mL) and washed with aq. HCl solution (3 x 50 mL). The combined aqueous washing solution was neutralized with NaHCO₃ solution and extracted with EtOAc (3 x 70 mL). The organic phases were combined with the previous organic phases, concentrated under vacuum and purified by column chromatography [26 x 3.3 cm, EtOAc/cyclohexane= 2:1 to 4:1 (v/v)]. The product was dried under oil pump vacuum (Note: strong foaming!).

Yield: 807 mg (2.34 mmol, 96%) colorless, glassy solid.

Rf = 0.20 (EtOAc/cyclohexane = 3:1 (v/v)) (254 nm, CAM: dark blue).
IR (ATR) = 3247, 3008, 2936, 2839, 1614, 1588, 1510, 1431, 1403, 1359, 1269, 1234, 1213, 1151, 1128, 1027, 965, 929, 856, 816, 787, 758, 693, 665, 615, 591, 559, 457 cm⁻¹.

mp: 41-43 °C.

The product is obtained as a mixture of rotamers (ratio rotamer 1/rotamer 2 = 1.14/1), to which NMR signals are assigned based on the peak intensities as well as the APT and HSQC spectra.

¹H-NMR (300.13 MHz, CDCl₃): δ = 6.90 – 6.48 (m, 6H, CH₉ arom), 4.94 (brs, 2H, ArOH), 3.94 – 3.77 (m, 6H, OCH₃), 3.66 – 3.34 (m, 4H, CH₂), 2.97 (s, 1.4H, NCH₃, rotamer 2), 2.87 (s, 1.6H, NCH₃, rotamer 1), 2.76 (t, 1.1H, CH₂, rotamer 1), 2.63 (t, 0.9H, CH₂, rotamer 2).

rotamer 1: ¹³C-NMR (75.47 MHz, CDCl₃): δ = 171.4 (C₀), 146.7 (C₀), 145.9 (C₀), 145.7 (C₀), 144.2 (C₀), 131.0 (C₀), 128.1 (C₀), 121.5 (CH₉ arom), 120.3 (CH₉ arom), 115.2 (CH₉ arom), 114.4 (CH₉ arom), 111.6 (CH₉ arom), 111.1 (CH₂ arom), 56.1 (OCH₃), 56.0 (OCH₃), 50.4 (CH₂), 40.8 (CH₂), 36.7 (NCH₃), 33.4 (CH₂).

rotamer 2: ¹³C-NMR (75.47 MHz, CDCl₃): δ = 171.6 (C₀), 146.8 (C₀), 145.9 (C₀), 145.7 (C₀), 144.7 (C₀), 130.1 (C₀), 128.4 (C₀), 121.5, 120.2 (CH₉ arom), 115.2 (CH₉ arom), 114.8 (CH₉ arom), 111.5 (CH₉ arom), 111.1 (CH₉ arom), 56.2 (OCH₃), 56.1 (OCH₃), 52.5 (CH₂), 40.2 (CH₂), 34.5 (CH₂), 33.9 (NCH₃).

HR-MS (HPLC-ESI): m/z [M+H]+ calcd for C₁₉H₂₃NO₅: 346.1649; found: 346.1650.

7-Hydroxy-1-(3-hydroxy-4-methoxybenzyl)-6-methoxy-2-methyl-3,4-dihydroisoquinolin-2-ium chloride (2)

A three-necked round bottom flask (250 mL) with magnetic stirring, air condenser, pressure equilibrator and gas valve was purged with Argon for 45 min. N-(4-hydroxy-3-methoxyphenethyl)-2-(3-hydroxy-4-methoxyphenyl)-N-methylacetamide (25) (1.00 g, 2.90 mmol, 1 eq) in dry MeCN (30 mL) was added in an Ar counter-stream followed by POCl₃ (824 µL, 8.69 mmol, 3 eq). The colorless solution was heated to reflux and complete conversion of the starting material was detected after 4 h (TLC). Celite (2.5 g) was added and the solvent was removed on the rotary evaporator. The product was purified by column chromatography [size: 30 x 1.8 cm, CHCl₃/MeOH/TFA = 14:2:1% (v/v/v)] and a second column chromatography [size: 30 x 1.8 cm, CHCl₃/MeOH/TFA = 8:1:1%, 7:1:1%, 6:1:1%, 5:1:1%, 4:1:1% (v/v/v)]. The product was dissolved in MeOH, filtered through cotton and the solvent was removed under vacuum. The product was then dissolved in distilled H₂O (50 mL), filtered through a pad of Celite (2 cm), treated with 12 M HCl (500 µL) and was dried under vacuum.

Yield: 821 mg (2.26 mmol, 78%) bright-yellow powder.

Rₛ = 0.29 (CHCl₃/MeOH/TFA = 4:1:1% (v/v/v)) (254 nm, CAM: blue).
IR (ATR) = 3540, 3091, 2847, 2749, 1661, 1624, 1603, 1570, 1524, 1435, 1382, 1341, 1301, 1239, 1210, 1187, 1151, 1131, 1093, 1042, 1016, 980, 948, 881, 867, 839, 814, 794, 761, 741, 715, 681, 647, 589, 558, 542, 482, 442, 409 cm\(^{-1}\).

mp: 143 - 145 °C.

HR-MS (HPLC-ESI): m/z [M-Cl]+ calcd for C\(_{19}\)H\(_{22}\)NO\(_4\): 328.1543; found: 328.1541.

1-(3-Hydroxy-4-methoxybenzyl)-6-methoxy-2-methyl-1,2,3,4-tetrahydroisoquinolin-7-ol (rac-1)

A dry 10 mL round-bottom flask with magnetic stirring bar was charged with 7-hydroxy-1-(3-hydroxy-4-methoxybenzyl)-6-methoxy-2-methyl-3,4-dihydroisoquinolin-2-ium chloride (2) (172 mg, 473 µmol, 1 eq) and MeOH (4 mL) and the yellow solution was cooled to 0 °C with an ice bath. NaBH\(_4\) (17.9 mg, 473 µmol, 1 eq) was added to the vigorously stirred solution and complete conversion of the starting material was detected after 20 min. The solvent was removed under vacuum, the crude product was adsorbed on Celite (MeOH) and the product was purified by column chromatography (size: 18 x 1.4 cm, CH\(_2\)Cl\(_2\)/MeOH/NH\(_3\)OH = 30:2:1%).

Yield: 80.6 mg (245 µmol, 51%) pale-yellow foam.

R\(_f\) = 0.38 (CH\(_2\)Cl\(_2\)/MeOH/NH\(_3\)OH = 9:1:1%) (254 nm, CAM: dark blue).

mp: 72 - 75 °C.

The NMR data is in accordance with literature.\(^{[3]}\)
2a Amination of homovanillin (28)

Although numerous common strategies were tested (i.e. an excess of substrate amine, variation of solvent, etc.), no suitable conditions were found to overcome side product formation. In general, it was possible to obtain the target compound 26 as the main product, accompanied by the tertiary amine as the major side product. In this context, it was possible to push the ratio between the target product and the overalkylated tertiary amine product up to 89% (Figure S1). However, the better this ratio became, the more additional side products appeared. For the direct amination using methylamine, the HCl salt was used rather than the free base, which led to higher yields of the target amine when MeOH was used as the solvent. Apart from the commonly used hydride sources NaBH₄, NaCNBH₃ and NaBH(OAc)₃, also the additional use of titanium (IV) isopropoxide Ti(OiPr)₄ was investigated in an alternative strategy,[6-8] however leading either to no product formation or complex product mixtures.

Scheme S2: Direct amination of substrate aldehyde 28 by using different amounts of MeNH₂·HCl.

![Scheme S2: Direct amination of substrate aldehyde 28 by using different amounts of MeNH₂·HCl.](image)

Figure S1: MeNH₂·HCl loading study for the direct reaction of homovanillin (28) to phenethylamine target 26. Blue: target product 2, grey: di-alkylated tertiary side product, IST: internal standard.

Overall, the direct chemical amination of homovanillin (28) with methylamine (base or salt) in an organic solvent led to low yields of the target product, usually accompanied by a significant number and quantity of byproducts, which consequently rendered this strategy unsuitable. As an alternative, an enzymatic methylation in an aqueous system was evaluated. For this purpose, various in-house imine reductases were tested for the reductive amination of aldehyde 28 with methylamine in the presence of NADPH and a glucose-based cofactor regeneration system. However, the enzymatic transformation did not lead to the desired compound but to an undefined product (most likely a dimer of 28) which only occurred in the presence of methylamine (Figure S2). Noteworthy, the structurally similar compounds phenylacetone and phenylacetaldehyde did not show this behaviour and were stable also in the presence of MeNH2 concentrations up to 300 mM.
Scheme S3: Target biotransformation for the amination of the substrate aldehyde 28.

3 Protein expression

Expression of PsDRR

Transformation into E. coli Arctic express(DE3) cells as the expression host

The plasmid containing the corresponding gene and chemically competent E. coli ArcticExpress (DE3) host cells (50 µL) were mixed in 1.5 mL microcentrifuge vials. The mixtures were incubated on ice for 30 min. Subsequently, the competent cell/DNA mixtures were shock-heated at 42 °C for 20 s. Autoclaved LB-medium (700 µL) was added to each sample followed by shacking at 37 °C, 300 rpm for 1 h. Subsequently, 100 µL of the mixture was applied onto previously prepared agar plates containing kanamycin (50 μg mL⁻¹) which were placed in an incubator at 37 °C overnight.

Preparation of overnight cultures (ONC)

50 mL plastic tubes were filled with 10 mL LB-medium and 10 µL of kanamycin stock solution (50 mg mL⁻¹) was added. A single culture from the agar plate was picked for inoculation and cultivated at 30 °C, 300 rpm overnight.

Main culture

A 1 L-baffled cultivation flask was filled with 330 mL autoclaved LB medium, supplemented with kanamycin solution (300 µL, 50 mg mL⁻¹, final conc.: 50 µg mL⁻¹) and 3.3 mL prepared overnight culture (1%). Cell growth proceeded at 30 °C, 120 rpm until OD₆₀₀ = 1.0 was reached. Subsequently, the cultures were induced with IPTG (1 M stock, final conc.: 0.5 mM). The cell cultures were incubated at 20 °C, 120 rpm for 20-24 h.

In order to harvest the enzyme, the cultures were centrifuged (5000 rpm, 4 °C for 20 min), resuspended in distilled water and centrifuged again (5000 rpm, 4 °C for 20 min). The pellets were resuspended again in 10 mL water per gram wet pellet. For the preparation of whole lyophilized cells, the resuspension was directly flash-frozen (liquid N₂) and lyophilized. Alternatively, the cell resuspension was sonicated (1 s on, 2 s off, 40% amplitude, 5 min) and centrifuged (14000 rpm, 4 °C 20 min). For the latter case, the pellets were discarded and
the supernatant was flash-frozen (liquid N$_2$) and lyophilized. The obtained whole lyophilized whole cells as well as lyophilized cell free extracts (CFE) were stored at -20 °C.

Expression of FDH and PtDH

Precultures were prepared as described above using kanamycin (final conc.: 50 µg mL$^{-1}$). Baffled cultivation flasks (1 L) were filled with 330 mL autoclaved LB medium, supplemented with kanamycin solution (300 µL, 50 mg mL$^{-1}$, final conc.: 50 µg mL$^{-1}$) and 3.3 mL prepared overnight culture (1%). Cell growth proceeded at 37 °C, 120 rpm until OD$_{600}$ = 0.5-0.7 was reached. Subsequently, the cultures were induced with IPTG (1 M stock, final conc.: 1 mM). The cell cultures were incubated at 20 °C (FDH) or 25 °C (PtDH), 120 rpm for 20-24 h. In order to harvest the enzyme, the cultures were centrifuged (5000 rpm, 4 °C for 20 min), resuspended in deionized water and centrifuged again (5000 rpm, 4 °C for 20 min). The pellets were resuspended again in 10 mL water per gram wet pellet. For the preparation of whole lyophilized cells, the resuspension was directly flash-frozen (liquid N$_2$) and lyophilized. Alternatively, the cell resuspension was sonicated (1 s on, 2 s off, 40% amplitude, 5 min) and centrifuged (14000 rpm, 4 °C 20 min). For the latter case, the pellets were discarded and the supernatant was flash-frozen (liquid N$_2$) and lyophilized. The obtained lyophilized whole cells as well as lyophilized cell free extracts (CFE) were stored at -20 °C.

Preparation of CYP-CPR strains (SalSyn and AtR2)

Chemically competent *E. coli* BL21(DE3) cells were transformed with the plasmid pCDF-1b containing the AtR2 encoding gene as described above for the transformation of PsDRR in *E. coli* Arctic express(DE3), albeit using spectinomycin (100 µg mL$^{-1}$) as antibiotic. The transformed strain was used for the following preparation of co-expressing strains harboring AtR2 and the respective CYP.

Preparation of electrocompetent *E. coli* BL21(DE3) cells harbouring SalSyn or P450 reductase

Preparation of overnight cultures

Falcon tubes were filled with 10 mL LB-media and spectinomycin solution (10 µL, 100 mg mL$^{-1}$, final conc.: 100 µg mL$^{-1}$) was added. A single colony from an agar plate (containing AtR2) was picked for inoculation and cultivated at 37 °C, 120 rpm overnight.

Cultivation and harvesting

LB medium (500 mL) supplemented with spectinomycin (final conc.: 100 µg mL$^{-1}$) was inoculated with fresh ONC (1% [v/v]). The cells were grown at 37 °C to an OD$_{600}$ of 0.5-0.7, cooled on ice for 20 min and transferred to sterile 400 mL centrifugation vessels. All steps were kept as close to 0 °C as possible and performed under sterile conditions. The cells were centrifuged at 4800 rpm for 15 min and the supernatant was discarded. The received pellets were resuspended carefully in 500 mL of ice-cold glycerol (10%). The cells were centrifuged at 4800 rpm for 15 min and the supernatant was discarded again. The pellets were resuspended carefully in 250 mL of ice-cold glycerol (10%). Subsequently, the cells were centrifuged at 4800 rpm for 15 min and the supernatant was discarded again. The pellets were resuspended in 20 mL of ice-cold glycerol (10%), centrifuged, and resuspended in 2 mL of ice-cold glycerol (10%). The suspensions were used to make aliquots of 80 µl which were flash-frozen in liquid nitrogen and stored at -80 °C until use.

The resulting electro-competent *E. coli* BL21(DE3) cells were transformed with pET-28a plasmids containing the respective SalSyn constructs by electroporation using an electroporation apparatus (MicroPulser™, Program: Ec2). The transformed cell solutions were applied onto previously prepared agar plates containing spectinomycin and kanamycin (final conc.: 50 and 100 µg mL$^{-1}$, respectively), which were placed in an incubator at 37 °C overnight.
Expression of CYP-CPR strains

Precultures were prepared as described above using both spectinomycin and kanamycin (final conc.: 50 and 100 µg mL$^{-1}$, respectively).

Cultivation

TB medium (5 mL) in 10 mL DWP was supplemented with 5 µL kanamycin solution and 5 µL spectinomycin solution (final conc.: 50 and 100 µg mL$^{-1}$, respectively) and inoculated with 1% ONC. Cells were grown at 37 °C, 120 rpm for 6 h. Cultures were induced with 5 µL IPTG (from 1 M stock, final conc.: 1 mM), supplemented with 5 µL 5-aminolevulinic acid (from 1 M stock, final conc.: 1 mM) and incubated at 13 or 20 °C [ArcticExpress(DE3) or BL21(DE3), respectively], 120 rpm for 22 h. The cultures were centrifuged (4000 rpm, 15 °C for 30 min) and the pellet was used for the biotransformations.

3 Enzymatic reduction of dehydroreticuline $2$ to $(R)$-reticuline $(R)$-1

Microcentrifuge vials (1.5 mL) were charged with a stock solution of D-glucose (1.25 M stock, final conc.: 9 mg mL$^{-1}$ = 50 mM) and a stock of PsDRR-enzyme preparation (lyophilized cells or CFE resuspended in buffer). GDH solution (50 mg mL$^{-1}$ stock, final conc.: 2 mg mL$^{-1}$), substrate solution (150 mM stock of $2$, final conc.: 10-100 mM.), NADP$^+$ solution (20 mM stock, final conc.: 0-2 mM), optionally cosolvent (DMSO, ethanol, isopropanol, acetone) and Tris-HCl buffer (0.1 M, pH 8.5) were added to reach a final volume of 500 µl. The reaction samples were mixed at 30 °C, 900 rpm for 20 h and quenched with 500 µl methanol. The samples were centrifuged, filtrated through cotton, and injected to HPLC-UV.

This procedure was slightly changed for different studies.

(R)-1-(3-hydroxy-4-methoxybenzyl)-6-methoxy-2-methyl-1,2,3,4-tetrahydroisoquinolin-7-ol [(R)-1]

A 250 mL baffled Erlenmeyer flask was charged with lyophilized cells harboring PsDRR (1.7 g, final conc.: 0.06 U mL⁻¹) and resuspended in 50 mL Tris-HCl buffer (0.1 M, pH 8.5). The iminium salt was added as a solid (200 mg, 0.54 mmol) whereas D-glucose was added as a 0.9 M solution in buffer (3.0 mL, final conc.: 50 mM). The reaction was started by the addition of 1 mL of a 54 mM NADP⁺ solution in buffer (final conc.: 1 mM). The cultivation flask was capped with a metal cap and shaken at 30 °C, 140 rpm. After complete consumption of the substrate (24 h), the reaction mixture was transferred to a 250 mL round bottom flask, flash-frozen and lyophilized overnight. The dried material was applied onto a silica-plug and eluted with EtOAc and MeOH. The filtrate containing the target product was concentrated under reduced pressure and the thus received yellow oil (~1.5 g) was purified by column chromatography (size: 29 x 1.9 cm, CH₂Cl₂/MeOH/NH₄OH = 15:1:1% to 7:1:1%) and dried under vacuum.
Yield: 162 mg (492 μmol, 92%) pale yellow crystals.

R<sub>f</sub> = 0.37 (CH<sub>2</sub>Cl<sub>2</sub>/MeOH/NH<sub>4</sub>OH = 9:1:1%) (254 nm, CAM: dark blue).

<sup>1</sup>H NMR (300.13 MHz, CDCl<sub>3</sub>) δ = 6.77-6.71 (dd, J = 11.3, 5.0 Hz, 2H, CH<sub>arom</sub>), 6.65 – 6.48 (m, 2H, CH<sub>arom</sub>), 6.36 (s, 1H, CH<sub>arom</sub>), 4.69 (burs, 2H, ArOH), 3.84 (d, J = 2.6 Hz, 6H, OCH<sub>3</sub>), 3.74 – 3.61 (m, 1H, CH), 3.25 – 3.10 (m, 1H, CH<sub>2</sub>), 3.03 (dd, J = 14.1, 6.1 Hz, 1H, CH<sub>2</sub>), 2.88 – 2.68 (m, 3H, CH<sub>2</sub>), 2.65 – 2.50 (m, 1H, CH<sub>2</sub>), 2.46 (s, 3H, NCH<sub>3</sub>).

<sup>13</sup>C NMR (75.47 MHz, CDCl<sub>3</sub>) δ = 145.46 (C<sub>q</sub>), 145.29 (C<sub>q</sub>), 145.16 (C<sub>q</sub>), 143.49 (C<sub>q</sub>), 133.24 (C<sub>q</sub>), 130.25 (C<sub>q</sub>), 125.27 (C<sub>q</sub>), 121.02 (CH<sub>arom</sub>), 115.76 (CH<sub>arom</sub>), 113.86 (CH<sub>arom</sub>), 110.71 (CH<sub>arom</sub>), 110.58 (CH<sub>arom</sub>), 64.60 (CH), 56.03 (OCH<sub>3</sub>), 55.95 (OCH<sub>3</sub>), 46.80 (CH<sub>2</sub>), 42.48 (NCH<sub>3</sub>), 41.06 (CH<sub>3</sub>), 25.06 (CH<sub>2</sub>).

Biotransformations employing SalSyn (CYP-CPR) strains: small-scale conversion studies

The pellets obtained from the cultivation of the respective CYP-CPR strains in 10 mL DWPs were resuspended in KPi buffer (0.5 mL, 0.1 M, pH 7.5) and transferred to 2 mL DWPs. The substrate (rac-2) was added (1 µL, 100 mM stock in DMSO, final conc.: 0.2 mM) as well as NADPH solution (1 µL, 25 mM stock, final conc.: 0.05 mM) and D-glucose solution (20 µL, 1.25 M stock, final conc.: 50 mM). The biotransformations were incubated at 30 °C, 180 rpm for 20 h. The samples were quenched with methanol (200 µL) and transferred to fresh microcentrifuge vials. The samples were centrifuged (14680 rpm, 4 °C for 10 min) and the supernatant was filtrated through cotton. The samples were analyzed via HPLC-MS and –UV and TLC.
Figure S25: A selected example of a RP-HPLC measurement from conversion studies of 1 to 3 using whole *E. coli* cells harboring SalSyn and CPR. Eluent: buffer (30 mM HCOONH$_4$, pH 2.8)/methanol/acetonitrile = 67/30/3 (isocratic).

Figure S26: Achiral RP-HPLC measurement of the mirror image reference of the target product salutaridine (3). Eluent: buffer (30 mM HCOONH$_4$, pH 2.8)/methanol/acetonitrile = 67/30/3 (isocratic). CAS: 4090-18-0.
Equation 1: Calculation of the HPLC yield of salutaridine 3. The factor 2 derives from the fact that rac-reticuline rac-1 was used as substrate source, i.e., a maximum of 50% conversion to salutaridine was possible; f = response factor. The factor 2 (bold) was involved since rac-1 was used rather than optically pure (R)-1, which is the only form accepted by the studied enzyme.

\[
HPLC \text{ yield (} \text{salutaridine}) \% = \frac{2 \times \text{peak area (salutaridine)} \times 100}{\text{peak area (salutaridine)} + f \times (\text{peak area (reticuline)})}
\]

\[
f = \frac{\varepsilon_{280} \text{(reticuline)}}{\varepsilon_{280} \text{(salutaridine)}} = \frac{\text{calibration slope (reticuline)}}{\text{calibration slope (salutaridine)}}
\]

Semi-preparative scale

4-Hydroxy-3,6-dimethoxy-17-methyl-5,6,8,14-tetrahydrodromorphinan-7-one [(+)-3]

Three 2 L baffled Erlenmeyer flasks filled with autoclaved 660 mL TB medium were supplemented with kanamycin and spectinomycin solution (660 µL each, final conc.: 50 and 100 µg mL⁻¹) and ONC (final conc.: 1%) of a cotransformed E. coli BL21(DE3) strain (harboring Nswap-KK-SalSyn and AtR2). The cells were grown at 20 °C, 120 rpm until OD₆₀₀ = 1.0 was reached and the cultures were induced with IPTG (660 µL each, final conc.: 1 mM) and supplemented with a 5-ALA solution (660 µL each, final conc.:1 mM).
The enzymes were expressed at 20 °C, 120 rpm for 22 h and the combined culture was centrifuged (5000 rpm, 4 °C, 20 min). The supernatant was discarded, and the pellet was resuspended in KPi buffer (200 mL, 0.1 M, pH 7.5). The cell suspension was distributed to eight 250 mL baffled Erlenmeyer flasks (25 mL per flask) which were supplemented with D-glucose solution (in total 6.7 mL, final conc.: 50 mM), NADPH solution (in total 4.0 mL, final conc.: 0.1 mM) and a substrate stock of (R)-1 (in total 12.8 mg per 1.5 mL DMSO, final conc.: 0.19 mM). The samples were incubated at 30 °C, 170 rpm for 24 h. Subsequently, the samples were pooled and the reaction mixture was centrifuged (5000 rpm, 4 °C, 20 min). The supernatant was transferred to a separatory funnel and the mixture was extracted with EtOAc (3x250 mL). The combined organic phase was concentrated under vacuum and the product was purified by column chromatography (size: 17 x 1.5 cm, CH2Cl2/MeOH/NH4OH = 6:1:1%). The ¹H-NMR was recorded (Figure S50) and fits to literature.[11]

Yield: 3.5 mg (11 μmol, 27%) yellow viscous oil.

¹H NMR (700 MHz, CD3OD) δ = 7.86 (s, 1H), 6.85 (d, J = 8.3 Hz, 1H), 6.67 (d, J = 8.3 Hz, 1H), 6.34 (s, 1H), 3.86 (s, 3H), 3.79 (d, J = 5.4 Hz, 1H), 3.74 (s, 3H), 3.41 – 3.34 (m, 1H), 3.05 – 2.97 (m, 1H), 2.63 (dd, J = 12.1, 3.6 Hz, 1H), 2.51 – 2.40 (m, 5H), 1.76 – 1.67 (m, 1H).

¹³C-NMR (175.11 MHz, CD3OD) δ = 183.35, 164.90, 151.81, 148.02, 145.56, 130.19, 125.10, 123.68, 123.01, 119.57, 111.56, 62.21, 56.72, 55.30, 47.98, 45.27, 41.65, 38.21, 33.60.
