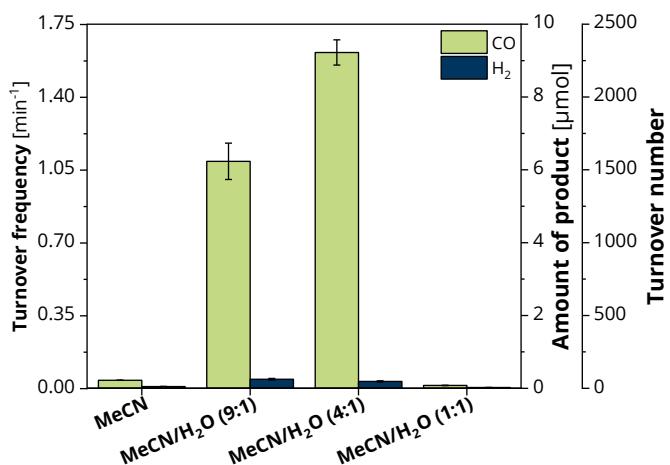

**Figure S5** Determination of the number of incident photons using  $K_3[Fe(C_2O_4)_3] \cdot 3H_2O$  as chemical actinometer.<sup>1</sup> Therefore, 2 mL containing 0.15 M  $K_3[Fe(C_2O_4)_3] \cdot 3H_2O$  in 0.05 M  $H_2SO_4$  were either irradiated with visible light ( $\lambda = 450$  nm, 1200 mcd, irradiation area 0.8 cm<sup>2</sup>) for 30 s or kept in the dark. Of both samples, 36  $\mu$ L were subsequently added to 0.4 mL of 0.1% phenanthroline in 0.5 M  $H_2SO_4$  buffered with sodium acetate (2.75 M) and diluted with 4.564 mL water. Each experiment was repeated two times.
