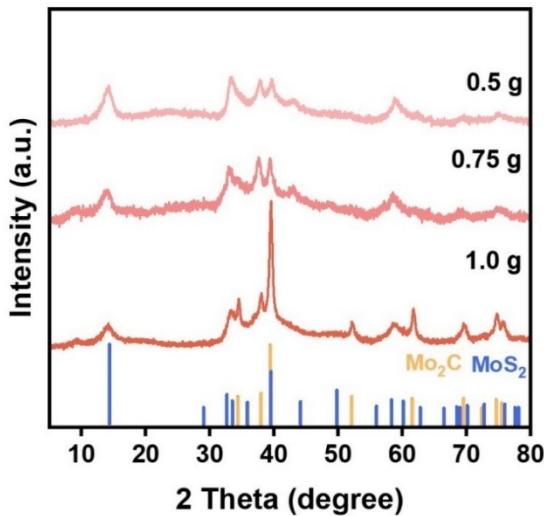

**Fig. S5.** (a) SEM and (b) TEM images, and (c-d) corresponding elemental mapping of MoS<sub>2</sub> nanosheets.

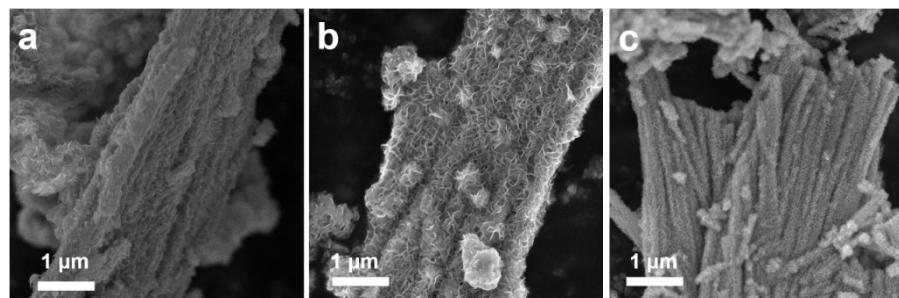

**Fig. S6.** Elemental mapping of  $\text{Mo}_2\text{C}@\text{MoS}_2$  heteronanorods.

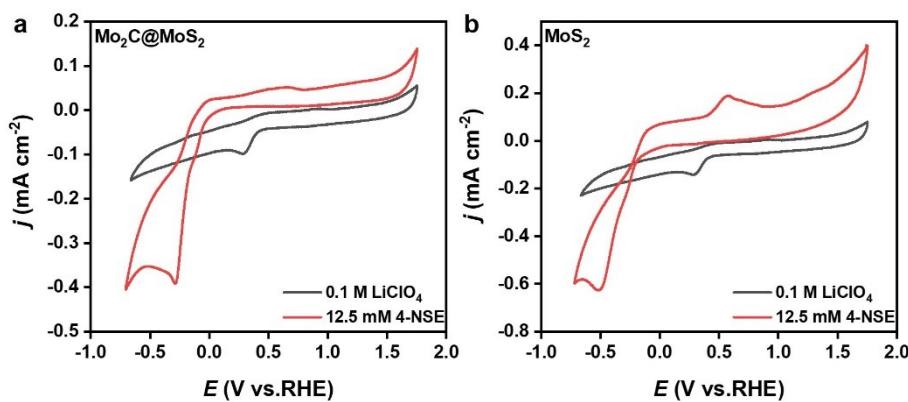

**Fig. S7.** (a)  $\text{N}_2$  adsorption-desorption isotherms and (b) pore-size distribution derived from BJH model of  $\text{Mo}_2\text{C}$ ,  $\text{Mo}_2\text{C}@\text{MoS}_2$  and  $\text{MoS}_2$ . To avoid the false signals in pore-size distribution, the adsorption data, rather than desorption ones, was adopted for the calculation with the classical BJH model. As a result, the distribution of nanoporosity is not obvious, probably due to the random formation of pores by stacking 1D and 2D building blocks.

(d) Estimation of  $C_{dl}$  of  $\text{Mo}_2\text{C}$ ,  $\text{Mo}_2\text{C}@\text{MoS}_2$  and  $\text{MoS}_2$ . Usually, the specific capacitance for a flat surface ( $1 \text{ cm}^2$ ) is in a range of  $20\text{-}60 \mu\text{F cm}_{\text{ECSA}}^{-2}$ , and herein a moderate value of  $40 \mu\text{F cm}_{\text{ECSA}}^{-2}$  is adopted to calculate ECSA and make comparison. The ECSA values of  $\text{Mo}_2\text{C}$ ,  $\text{Mo}_2\text{C}@\text{MoS}_2$  and  $\text{MoS}_2$  were 5.738, 11.306 and 2.475

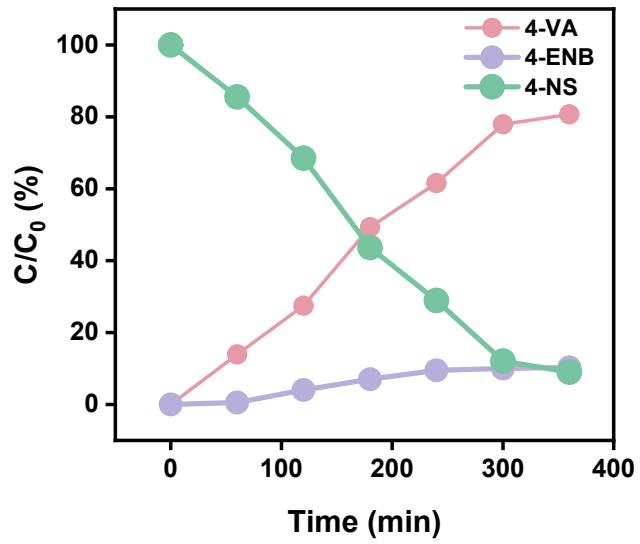

$\text{cm}_{\text{ECSA}}^2$ , respectively.
