SasView model equations

Core Shell Sphere

Following model provided the form factor, $P(q)$, for a spherical particle characterized with a core-shell structure. The form factor was normalized by the particle volume.

The 1D scattering intensity was calculated in the following way,

$$P(q) = \frac{\text{scale}}{V} F^2(q) + \text{background}$$  \hspace{1cm} (S1)

where

$$F(q) = \frac{3}{V_s} \left[ V_c (\rho_c - \rho_s) \frac{\sin(q r_c) - q r_c \cos(q r_c)}{(q r_c)^3} + V_s (\rho_s - \rho_{solv}) \frac{\sin(q r_s) - q r_s \cos(q r_s)}{(q r_s)^3} \right]$$  \hspace{1cm} (S2)

where $V_s$ is the volume of the whole particle, $V_c$ is the volume of the core, $r_s = radius + thickness$ is the radius of the particle, $r_c$ is the radius of the core, $\rho_c$ is the scattering length density of the core, $\rho_s$ is the scattering length density of the shell, $\rho_{solv}$ is the scattering length density of the solvent. In eq S2, we see that both scattering from the whole particle and the core are contributing to $P(q)$. [1] For cylindrical core shell model see [2].

Phase diagram
**Figure S1.** Phase diagram aims to display all measurements done with SAXS.

Figure S3. Fd3m structure used for calculation of scattering pattern. The coordinates of 24 micelles in the unit cell are calculated based on the structure presented by Seddon and Templer (Handbook of Biological Physics, 1995). For visualisation, sphere radii of 0.1 and 0.05 are used.
Figure S4. Scattering intensity generated by Fd3m structure consisting of $16^3 = 4096$ unit cells. All radii are taken equal, $R=0.1$. The legend shows standard deviations of $x,y,z$ coordinates of spheres from their equilibrium positions.
Figure S5. Scattering intensity generated by Fd3m structure consisting of $8^3=512$ unit cells. The standard deviations of $x,y,z$ coordinates of spheres from their equilibrium positions are 0.05. The legend shows the values of radii. For calculation of $q$, the distances are normalized by the unit cell size.
Intermediate phase

The intermediate phase

1% EtOH

Figure S6. Similarities between the intermediate phases.
Figure S7. Intermediate phase observed through microscope with polarized light. a) 35/65 SPC/GDO with 3.15% H₂O\(^{\text{PBS}}\). b) 47.5/52.5 SPC/GDO 1% H₂O\(^{\text{PBS}}\).
Figure S9. The structure of Pm3n (Q^{223}) phase. The coordinates of 8 micelles in the unit cell are calculated based on the structure presented by Vargas et al. (J. Mol. Biol., 1992, 225, 137-145)
Figure S10. Scattering intensity generated by Pm3n structure consisting of $16^3 = 4096$ unit cells. Each unit cell consists of 8 spherical micelles. The legend shows the micelle radii (the radius of the micelle in 0, 0 position is shown first). The standard deviation of x,y,z coordinates of spheres is 0.025.
**Figure S11.** The structure of Pm3n (Q^{223}) phase. The coordinates of 8 micelles of the unit cell (2 spherical and 6 elongated) are calculated based on the structure presented by Fontell, 1990. The elongated micelles are modelled as two spheres placed close to each other. The total structure consists of 14 spheres per unit cell.
Figure S12. Scattering intensity generated by Pm3n structure consisting of $16^3 = 4096$ unit cells. Each unit cell consists of 8 spherical micelles of two different sizes (blue curve) or 2 spherical plus 6 elongated micelles (red curve). The legend shows the micelle radii used in calculations.
Hexagonal phase

**Figure S13.** Scattering curves generated by 2D swelling of hexagonal phase with increasing amount of H$_2$O$^{(PBS)}$. 

S16
Figure S14. Swelling of hexagonal phase. In general, swelling can be described as
\[ \ln d = \ln d_0 - \frac{1}{p} \ln \phi_L. \] For 1D swelling the slope is expected to be 1, and 2D swelling -1/2. Here the swelling of hexagonal phase fits to neither with a slope of -1/0.58.
Additional equations

Mole Fraction

Calculations of mole fractions for lipid 1 in the binary system:

\[ x_1 = \frac{1}{1 + \frac{(1/w_1)M_1}{M_2}} \]  \hspace{1cm} (S3)

Determination of mole fractions for lipid 1 for three component system:

\[ x_1 = \frac{w_1/M_1}{w_1/M_1 + w_2/M_2 + w_3/M_3} \]  \hspace{1cm} (S4)
