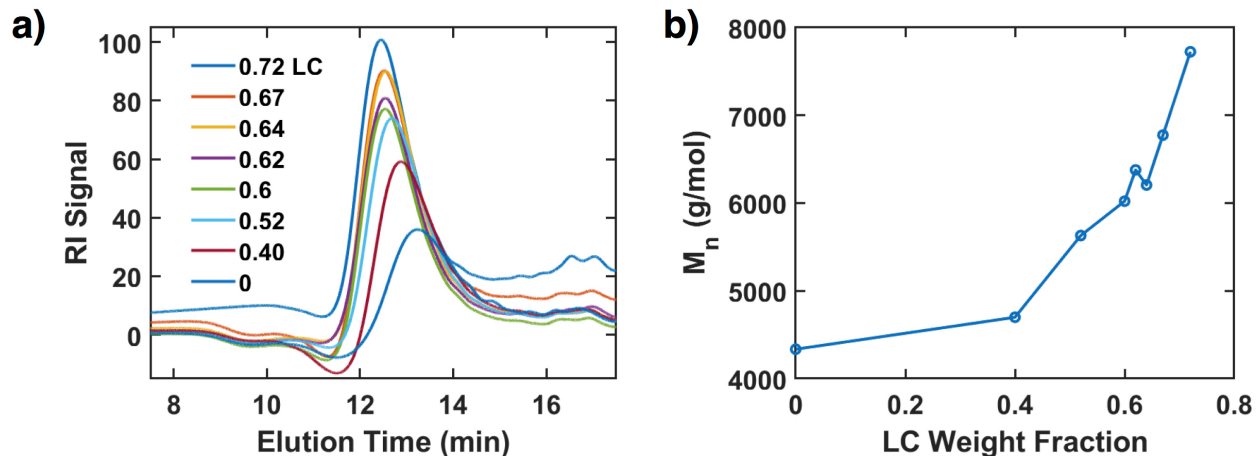

Figure S2. a) Results of gel permeation chromatography (GPC) on TMO<sub>x</sub> series of oligomers. GPC was performed on an Ecosec HLC-8320 GPC with chloroform as a solvent at a flow rate of 0.5 mL/min through a 15 cm TSKgel Super HM-N column. Samples were prepared in chloroform at a concentration of 1 mg/mL and were filtered through a 0.22  $\mu$ m syringe filter prior to measurement. Refractive index detector data was used for analysis. b) Number average molecular weight of oligomers calculated using a polystyrene standard against liquid crystalline weight fraction.

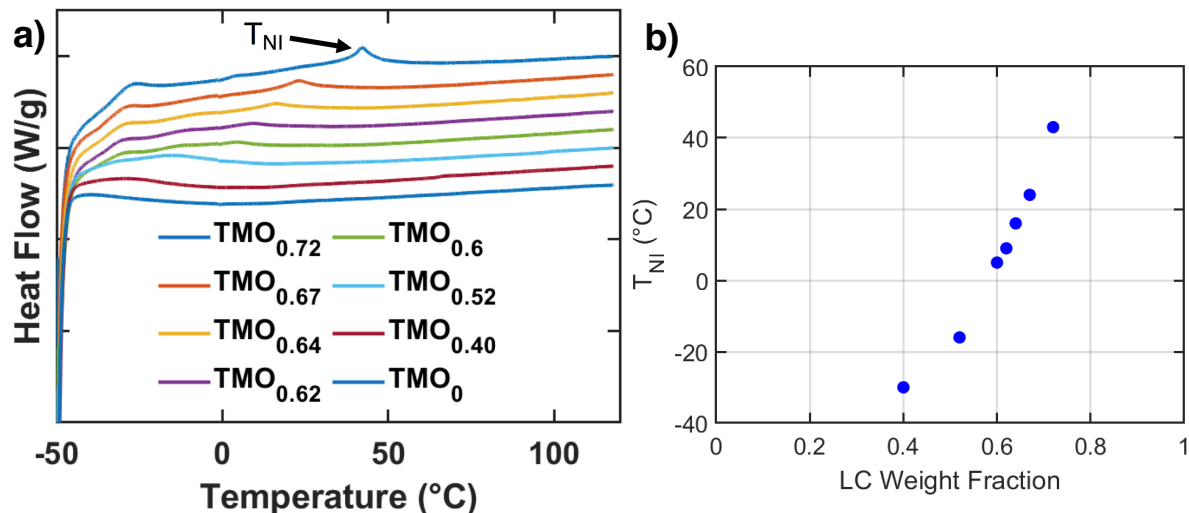

Figure S3. a) Differential Scanning Calorimetry (DSC) data of TMO<sub>x</sub> oligomers. DSC was performed on a TA Instruments Discovery DSC 2500. Samples of approximately 5 mg were heated to 120°C, cooled to -50°C, then heated to 120°C. Heating rates of 10°C/min were used with a cooling rate of 5°C/min. Data is reported from the second heating cycle. The highest temperature endothermic peak corresponds to T<sub>NI</sub>. b) T<sub>NI</sub> of the TMO<sub>x</sub> oligomers as a function of liquid crystalline weight fraction.
