8. Stability tests in DMF, ethanol, and water

The stability of the three solids in DMF, ethanol, and water was evaluated by suspending samples in these solvents and examining signs of degradation at the end of the period by powder X-ray diffraction, infrared spectroscopy and visual inspection of the supernatant. For the tests, 10 mg of solid was suspended in 10 ml of solvent in nearly full closed glass vials. The suspensions were stirred for 1 h, and then left at rest for a determined amount of time. At the end of the period, the compounds were separated from their solvents by centrifugation and washed with ethanol. The isolated samples were characterized by PXRD and IR spectroscopy.

Table S6. Refined values of hyperfine parameters of $\text{Na}\{\text{Fe}(\text{DSBDC})\}\cdot 2.5\text{H}_2\text{O}$ at 7K. At low temperature, magnetic ordering runs along the edge-sharing $\{\text{FeS}_4\text{O}_2\}_n$ chains and FeS_4O_2 sites are split into two inequivalent positions. On the other hand, FeO_6 sites are not affected by this magnetic ordering as they are not in direct contact with $\{\text{FeS}_4\text{O}_2\}_n$ chains.
