## 16 **Experimental Section:**

### 17 **Synthesis of MIL-100(Fe)**

18 Preparation of MIL-100(Fe) by modified from previous literature,<sup>1</sup> using a  
19 reaction mixture containing 0.82 g of Fe powder, 2.06 g of 1,3,5-benzene  
20 tricarboxylic acid (BTC), 0.2 ml of hydrofluoric acid (HF), and 2 mL of nitric acid  
21 (HNO<sub>3</sub>) in 80 mL of water. The reaction is carried out in a Teflon-lined autoclave at  
22 150 °C for 6 days, with an initial heating ramp of 12 hours and a final cooling ramp  
23 of 24 hours. The light-orange solid product is obtained by filtration and washed with  
24 hot deionized water, followed by ethanol washing and drying in the oven.

### 25 **Synthesis of MIL-88B(Fe)**

26 The synthesis of MIL-88B(Fe) was carried out according to the previous  
27 literature.<sup>2</sup> 332 mg of terephthalic acid (1,4-BDC) and 344 mg of iron(III) acetate  
28 were mixed with 10 mL of MeOH in a Teflon reactor. The mixture was placed in an  
29 oven and heated at 100 °C for 2 hours before rapidly cooling. The resulting orange  
30 solid was then recovered via filtration. It was washed three times with ethanol  
31 (EtOH) to activate the MOF and remove free ligands. The washing stage involves  
32 soaking the MOF in EtOH for 10 minutes, centrifuging, and repeating this process  
33 three times.

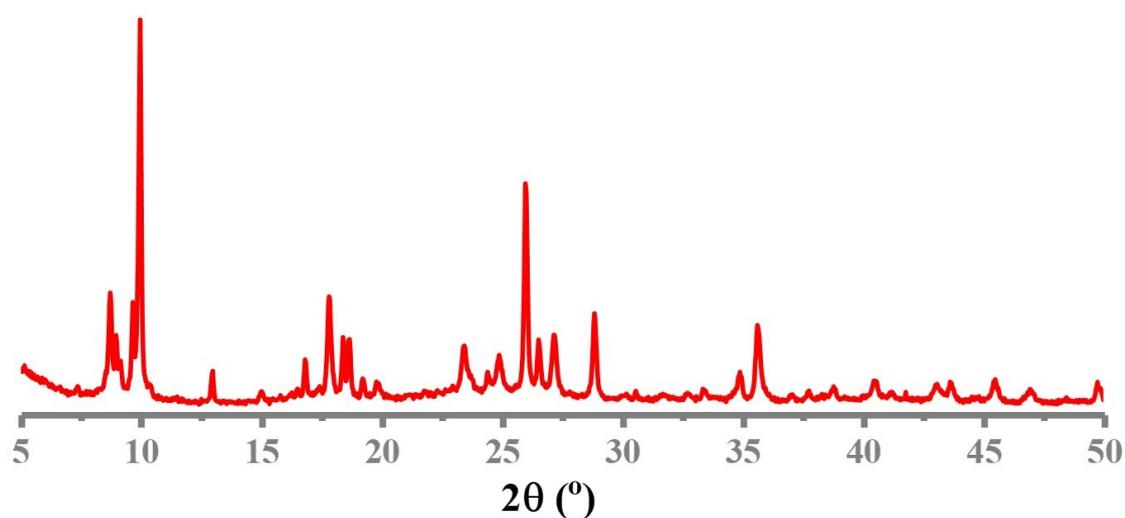

### 34 **Synthesis of Fe-1,4-NDC MOF**

35 The synthesis of Fe-1,4-NDC MOF was carried out according to earlier  
36 research.<sup>3</sup> 162 mg of iron(III) chloride and 108 mg of 1,4-Naphthalene dicarboxylic  
37 acid, and add 10 mL of H<sub>2</sub>O to the reaction vessel and thoroughly stir to establish  
38 homogeneity. Place the mixture in a 23 mL Teflon reactor in the oven to heat to 180  
39 °C. The reaction will occur for one day at 180 °C. Allow it to cool to room

40 temperature when the reaction time has passed. To separate the solid MOF product,  
41 centrifuge the reaction mixture. To eliminate any contaminants, wash the obtained  
42 MOF powder with distilled water. Allow the MOF powder to dry completely at 75  
43 °C. Once the MOF powder is dry, it is ready for further characterization or  
44 experiment use.
