Materials.
Cesium bromide (CsBr, 99.9%), bismuth tribromide (BiBr₃, 99%), octadecene (ODE, 90%), oleylamine (OAm, 90%), oleic acid (OA, 90%), dimethyl sulfoxide (DMSO, 99.9%), Nitric acid (HNO₃) were purchased from Aladdin company. Bismuth nitrate pentahydrate (Bi(NO₃)₃•5H₂O, 99%), ammonium metavanadate (NH₄VO₃, 99%) were obtained from Shanghai Xian Ding Biotechnology Co. Isopropanol (IPA, 99.7%), hexane (anhydrous, 98%), Ethanol (EtOH, 99.7%). All the chemicals were analytical grade (A.R.) and used without further purification.

Synthesis of BiVO₄ nanosheets
BiVO₄ nanosheets (BiVO₄ NSs) were synthesized by colloidal two-phase method. First, a 25 ml three-neck flask was taken and OA (1 mL), OM (1 mL) and ODE (10 mL) were added, after which 0.242 g Bi(NO₃)₃•5H₂O was dispersed in it under stirring and heated to 160°C under N₂ atmosphere until it was completely dissolved to form a transparent solution. Subsequently, the temperature was reduced to 100°C. Another 20 ml glass vial was taken and 0.116 g NH₄VO₃ was dissolved in 12 ml of 2.4 M aqueous nitric acid solution and slowly injected into the above solution containing dissolved Bi(NO₃)₃ and kept at 100°C for 40 min. The solution was naturally cooled to room temperature and then extracted by adding a mixture of hexane and ethanol (v/v = 1:1), the upper yellow solution was taken and centrifuged to obtain a yellow precipitate washed three times with a mixture of hexane and ethanol, and finally dried in an oven at 60°C for 12 h.

Synthesis of Cs₃Bi₂Br₉
For the synthesis of ligand free Cs₃Bi₂Br₉, 0.36 mmol of CsBr and 0.24 mmol of BiBr₃ were dissolved in 4 mL of dimethyl sulfoxide (DMSO) in a molar ratio of 3:2 to form the precursor solution. Under vigorous stirring, 1 mL of Cs₃Bi₂Br₉ precursor solution was added dropwise to 50 mL of isopropanol, stirred for 3 min at room temperature and then centrifuged at 6000 rpm for 5 min. The obtained precipitate was washed twice with isopropanol and ethanol, respectively, and dried in an oven at 60°C for 12 h.

Synthesis of the Cs₃Bi₂Br₉/BiVO₄ heterojunction
A certain amount of BiVO₄ NSs was added to 1 mL Cs₃Bi₂Br₉ precursor solution (CsBr/BiBr₃/DMSO) to be ultrasonically dispersed well, and the mixed Cs₃Bi₂Br₉ precursor solution was added dropwise to 50 mL of isopropanol solution under vigorous stirring at room temperature for 3 h. Finally, the Cs₃Bi₂Br₉/BiVO₄ composites were centrifuged at 6000 rpm for 5 min, washed twice with isopropanol and ethanol, respectively, and dried under vacuum at 60°C for 6 h. After drying for 6 h, the Cs₃Bi₂Br₉/BiVO₄ composites were harvested. Specifically, different ratios of Cs₃Bi₂Br₉/BiVO₄ composites varied the amount of BiVO₄ NSs by fixing the amount of Cs₃Bi₂Br₉ precursor (CsBr/BiBr₃/DMSO), the weight percentages of BiVO₄
relative to Cs$_3$Bi$_2$Br$_9$ were 3%, 5%, and 7%, respectively, and were labeled 3% Cs$_3$Bi$_2$Br$_9$/BiVO$_4$, 5% Cs$_3$Bi$_2$Br$_9$/BiVO$_4$, and 7% Cs$_3$Bi$_2$Br$_9$/BiVO$_4$.

**Materials Characterization**

The morphology of the prepared samples was obtained by scanning electron microscopy (SEM, Hitachi S-4800). The detailed heterojunction structures of the samples were obtained by transmission electron microscopy (TEM, TecnaiG2F20) at an accelerating voltage of 200 kV. Zeta potential was performed using Zetasizer Nano ZS (Malvern Instruments, U.K.), the samples were dispersed in ethanol solutions. The phase structure of the samples was measured by X-ray diffraction (XRD) via Bruker D8 Focus with Cu Kα radiation. X Ray photoelectron spectroscopy (XPS) tests were performed using Thermo Scientific K-Alpha spectrometer. The Fourier transform infrared spectroscopy (FTIR) spectra were examined on a spectrometer (Bruker ALPHA-E, Germany). The optical properties were characterized by UV-visible diffuse reflectance spectroscopy (UV−vis DRS, Shimadzu UV-3600) using BaSO$_4$ as a reflectance standard. Steady-state photoluminescence (PL) spectra were recorded on Hitachi F-7000 spectrometer and the excitation wavelength was 420 nm. Time resolved PL measurement was performed using Edinburgh FS5 spectrofluorometer with pulsed LED. Electron Spin Resonance Spectroscopy (ESR, JES-FA200) was used to analyze reactive radicals. The detection of •O$_2^-$ was conducted in acetonitrile solution with 5,5-dimethyl-1-pyrroline-N-oxide (DMPO) as the spin trap.

**Photocatalytic experiments**

The photocatalytic degradation of Sudan III was carried out in a glass vial at room temperature under cooling water circulation. The irradiation was conducted with a 300 W Xe lamp with 400 nm cut-off filter (Beijing Zhongjiao Jinyuan Co., Ltd.). The calibrated light intensity was 100 mW cm$^{-2}$. Briefly, 20 mg of photocatalyst was mixed with 20 mL of Sudan Red III ethanol solution (10 mg/L). The mixture was stirred in the dark for 30 min to reach the adsorption-desorption equilibrium. During the photocatalytic reactions, 2 mL of the suspension was transferred every 8 min and centrifuged for separation. The degradation rate of Sudan Red III was monitored by optical absorbance method using a DH-2000-BAL absorption spectrometer from the United States. For MR and MB photocatalysis, the photocatalytic degradation process was the same except for the monitor wavelength.

In order to better understand the photocatalytic degradation mechanism, active radical trapping experiments were performed under the same conditions. Isopropyl alcohol (IPA), p-benzoquinone (BQ) and ammonium oxalate ((NH$_4$)$_2$C$_2$O$_4$) at 0.5 mmol/L were used as hydroxyl radical (•OH), superoxide radical (•O$_2^-$) and hole (h$^+$) trapping agents for the evaluation of the main active substances, respectively.

**Photoelectrochemical testing**

Photoelectrochemical tests on the samples (BiVO$_4$, Cs$_3$Bi$_2$Br$_9$, Cs$_3$Bi$_2$Br$_9$/BiVO$_4$)
were performed on an electrochemical workstation (CHI660, Shanghai Chenhua, China) with a conventional three-electrode system. 0.1 M tetrabutylammonium hexafluorophosphate (TBAPF$_6$) in Ethanol solution was used as the electrolyte. For the preparation of the working electrode, a mixture of 3 mg of catalyst, 200 μL of isopropanol and 10 μL of nafion solution was sonicated for 1 h. Then, the suspension was dropped onto indium tin oxide (ITO) glass and dried. The reference electrode was an Ag/AgCl electrode and the counter electrode was a Pt electrode. The impedance tests were performed at open circuit potential and in the dark. For the photocurrent studies, measurements were made at room temperature at open circuit potential using a 300 W Xe lamp (AM 1.5 G, 100 mW cm$^{-2}$) irradiation.
