Characterization

Scanning electron microscopy (SEM) was characterized by Keol 2012 microscope. Transmission electron microscopy (TEM) was characterized by JEOL 1011 microscopy (Japan). Fourier transform infrared spectra (FT-IR) was characterized by Thermo Fisher Scientific 10 infrared spectrometer analysis. Matrix-assisted laser desorption ionization time-of-flight mass spectrometry (MALDI-TOF MS) was used in an autoflex max (Bruker, USA). Nanoflow liquid chromatography–tandem mass spectrometry (Nano-LC-MS/MS) was used in Thermo Scientific TM Orbitrap Fusion Lumos (Thermo Scientific, USA).

Tryptic digestion of the standard proteins and actual sample.

HRP (1 mg) and BSA (2 mg) were dissolved in 100 μ L of deionized water. After 10 minutes of ultrasound, the protein was denatured in boiling water at 100 °C for 10 minutes. Then 100 μ L of ammonium bicarbonate (50 mM) was added together with the addition of trypsin at protein to trypsin ratio of 40: 1 and incubated the solution for 16 h at 37 °C to fully digest the protein. The obtained solution is collected in a centrifuge tube and stored at -20 °C for further use.

Serum (1 mg) was diluted in NH₄HCO₃ (50 mM) buffer and denatured in boiling water at 100 °C for 10 minutes. The mixture was reduced with DTT (200 mM) and NH₄HCO₃ (50 mM) at 37 °C for 1 h and alkylated with IAA (400 mM) and NH₄HCO₃ (50 mM) at 37 °C for 1 h in the dark. Then, the resulting mixture was incubated with trypsin (trypsin/protein is 1/40, w/w) at 37 °C for 16 h. Tryptic digests were lyophilized for further enrichment and analysis.

MALDI-TOF MS, nano-LC-MS/MS and data analysis.

This part of data search and analysis refers to our group's previous work, and the specific information can be found in References2 and 18.

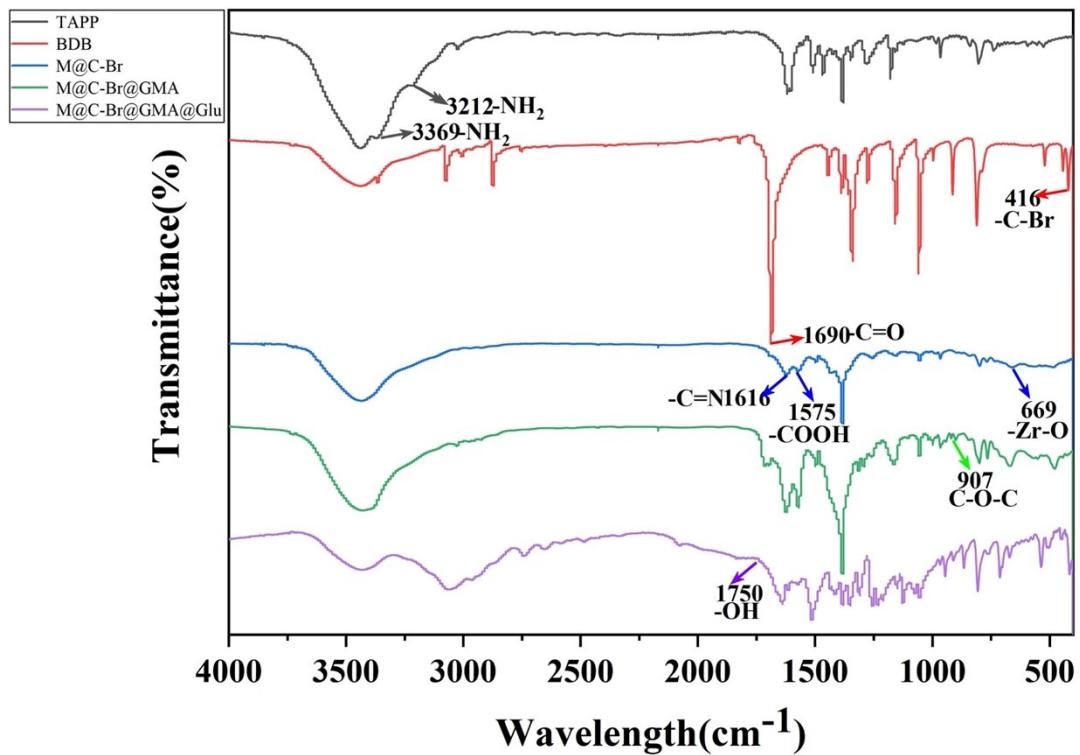

Fig. S1. The FT-IR spectra of TAPBB, BDB, M@C-Br, M@C-Br@GMA, and M@C-Br@GMA@Glu.

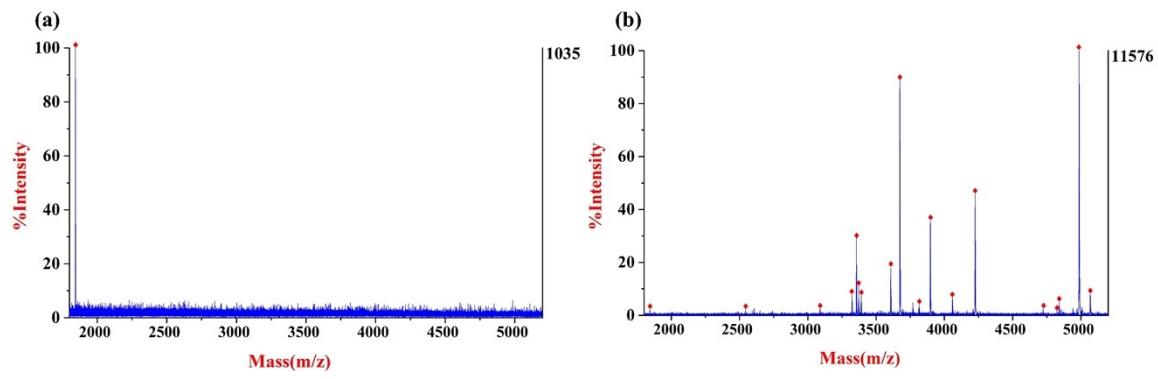

Fig. S2. MALDI-TOF mass spectra of HRP digests (a) before enrichment and (b) after enrichment with M@C-Br@GMA@Glu, glycopeptides peaks are signed as “♦”.

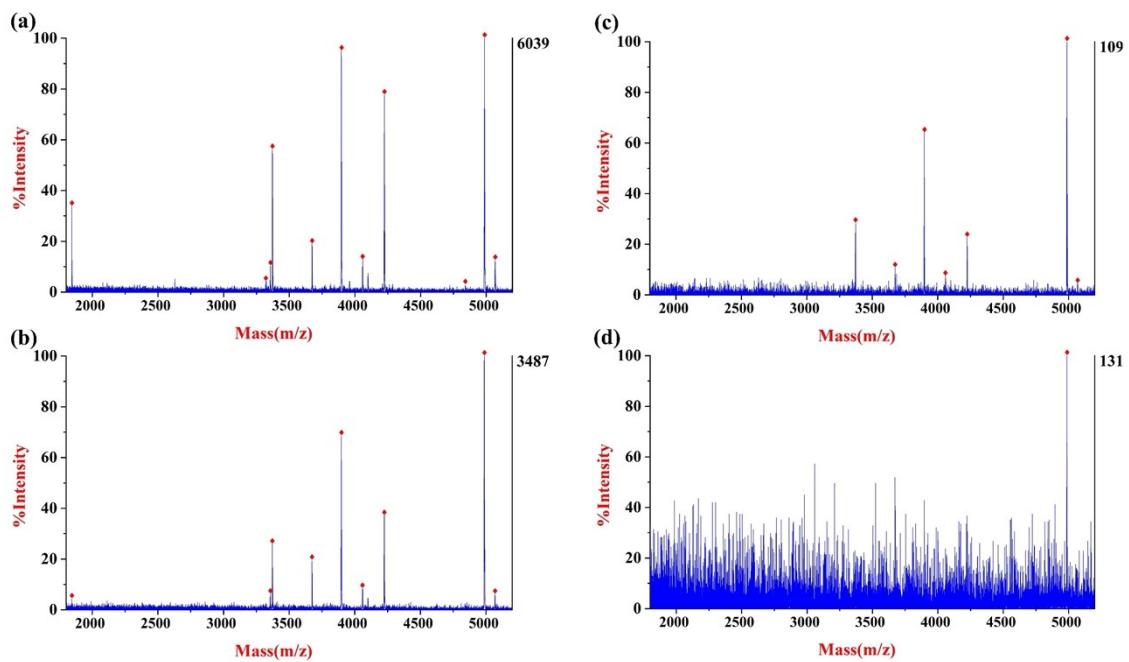

Fig. S3. MALDI-TOF Mass spectra of enriched glycopeptides from a mixture of HRP and BSA with a molar ratio, (a) 1:250, (b) 1:500, (c) 1:1000, (d) 1:2000, glycopeptide peaks are signed as “♦”.

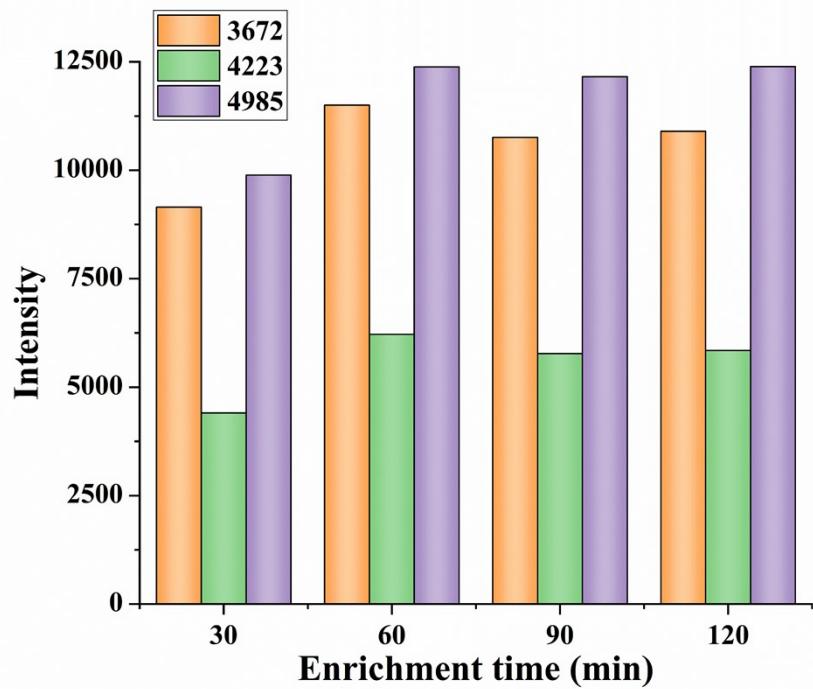

Fig. S4. MALDI-TOF MS spectra of HRP tryptic digest eluted with different time (30 min, 60 min, 90 min, 120 min) by M@C-Br@GMA@Glu.

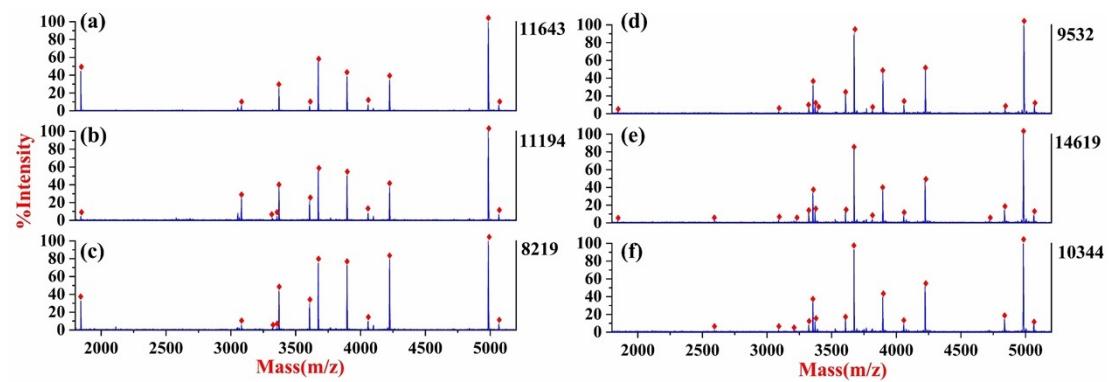

Fig. S5. MALDI-TOF MS spectra of HRP tryptic digest eluted with different loading buffer by M@C-Br@GMA@Glu: (a) for 0.5% TFA dissolved in 90% ACN aqueous solution, (b) for 1% TFA dissolved in 90% ACN aqueous solution, (c) for 3% TFA dissolved in 90% ACN aqueous solution, (d) for 0.5% TFA dissolved in 95% ACN aqueous solution, (e) for 1% TFA dissolved in 95% ACN aqueous solution, (f) for 3% TFA dissolved in 95% ACN aqueous solution, glycopeptides peaks are signed as “♦”.

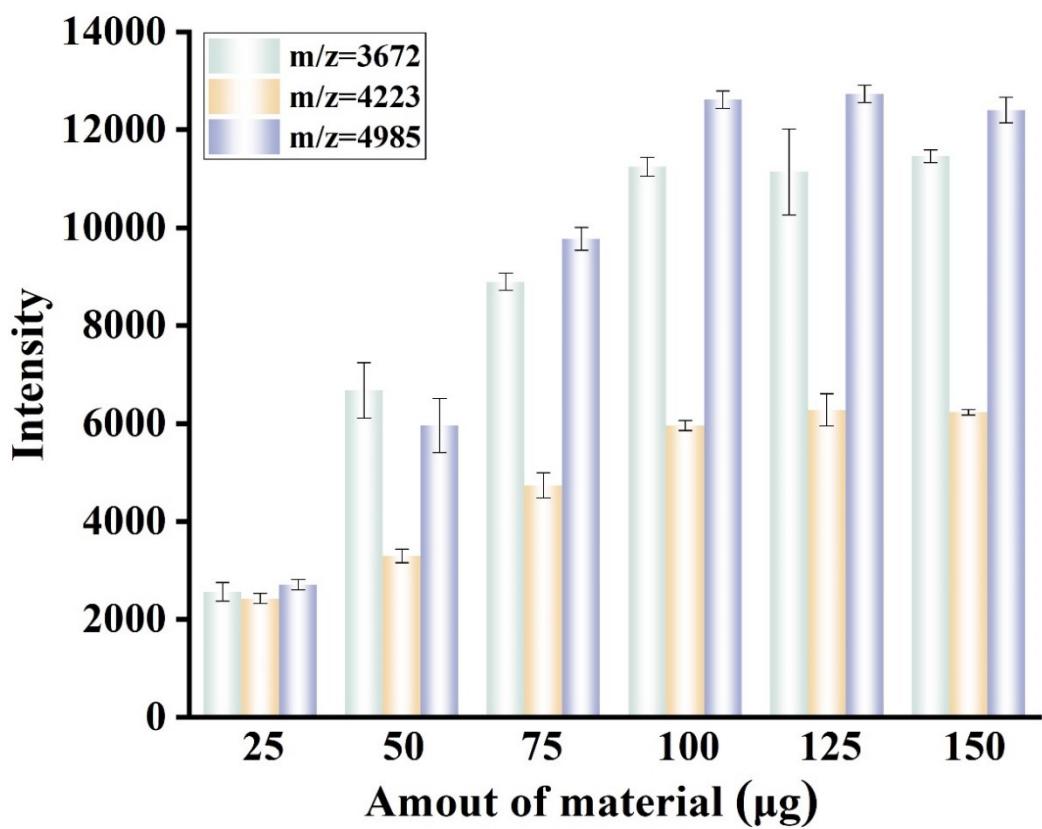

Fig. S6. Evaluation of the loading capacity of M@C-Br@GMA@Glu composites through enrichment for glycopeptides from HRP digests by different amounts of the composites.

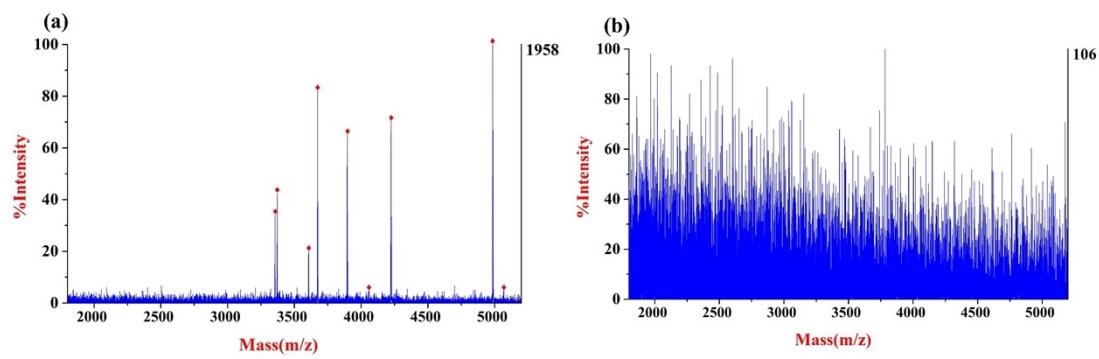

Fig. S7. MALDI-TOF MS spectra of the supernatant after the enriched by M@C-Br@GMA@Glu:
(a) 75 μ g, (b) 100 μ g. Glycopeptide peaks are signed as “♦”.

Table S1. The detailed information of glycopeptides derived from HRP after enrichment by M@C-Br@GMA@Glu. #: Glycosylation site.
